Global Lung Cancer Academy

Welcome and Meeting Overview

Solange Peters, MD

Meet the faculty

CO-CHAIRS

Corey J. Langer, MD, FACP
University of Pennsylvania, PA, USA

Solange Peters, MD
University Hospital of Lausanne
Lausanne, Switzerland

FACULTY

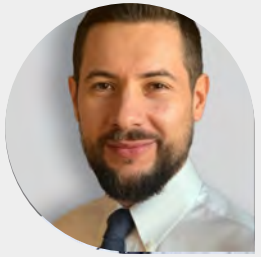
Benjamin Besse, MD, PhD
Institute Gustave Roussy
Villejuif, France

Federico Cappuzzo, MD, PhD
AUSL della Romagna
Ravenna, Italy

Anne-Marie Dingemans, MD, PhD
Erasmus Medical Center
Rotterdam, the Netherlands

Enriqueta Felip, MD, PhD
Vall d'Hebron University Hospital
Barcelona, Spain

Umberto Malapelle, PhD
University of Naples Federico II
Naples, Italy



Antonio Passaro, MD, PhD
European Institue of Oncology
Milan, Italy

Johan Vansteenkiste, MD, PhD
University Hospital KU Leuven
Leuven, Belgium

Objectives of the program

- Discuss current evidence-based practices in the diagnosis and treatment of lung cancer
- Learn about current genomic testing practices and how these results inform treatment decisions
- Understand advances made in immunotherapy for lung cancer and how these agents are being used in clinical practice
- Gain insights into the latest developments in targeted therapies used for lung cancer
- Promote best practice cancer care via the review of clinical patient cases
- Recognize the major clinical trials underway to further develop treatment in lung cancer
- Learn about the regional challenges and differences in lung cancer treatment patterns in Europe

Day 1: Plenary Sessions

Monday, 7 November 2022 from 15.00 – 19.00 CET

Time	Title	Speaker
15.00 – 15.10 (10 min)	**Welcome and Meeting Overview** • Introduction to audience response system (ARS)	Solange Peters
15.10 – 15.40 (30 min)	**Recent Developments in NSCLC – What is New in Research and Management?** • Overview of recently presented data in NSCLC	Corey Langer
15.40 – 16.00 (20 min)	**Biomarker and Mutational Testing for NSCLC – What, Where, and When?** • NSCLC heterogeneity, overview of current and emerging biomarkers and co-mutations, and best practices and guidelines for testing at diagnosis and during treatment of NSCLC	Umberto Malapelle
16.00 – 16.20 (20 min)	**Targeted Therapies for Early-Stage NSCLC – Evidence-Based Data and Perspectives** • Summary of targeted therapies for different NSCLC genotypes	Enriqueta Felip
16.20 – 16.40 (20 min)	**Adjuvant Therapy in Resectable NSCLC** • Current standard practices and ongoing studies	Benjamin Besse
16.40 – 17.10 (30 min)	**Tumor Board Discussion** • Case 1 (10 min) • Case 2 (10 min) • Discussion and Q&A (10 min)	Moderator: Solange Peters Johan Vansteenkiste Daphne Dumoulin All faculty
17.10 – 17.20 (10 min)	***Break***	
17.20 – 17.40 (20 min)	**Neoadjuvant Therapy for NSCLC – Is It Ready for Prime Time?** • Current state of neoadjuvant therapy in resectable NSCLC	Anne-Marie Dingemans
17.40 – 18.00 (20 min)	**Locally Advanced Unresectable NSCLC – What Are the Options?** • Current standard practices and ongoing studies	Antonio Passaro
18.00 – 18.30 (30 min)	**Debate: Adjuvant or Neoadjuvant Therapy for NSCLC** • Neoadjuvant therapy (10 min) • Adjuvant therapy (10 min) • Discussion and voting (10 min)	Moderator: Corey Langer Johan Vansteenkiste Benjamin Besse All faculty
18.30 – 18.50 (20 min)	**Options After Early-Stage Relapse** • Current and emerging treatment options after early-stage relapse	Federico Cappuzzo
18.50 – 19.00 (10 min)	**Session Close** • ARS questions	Corey Langer

Day 2: Plenary Sessions

Monday, 14 November 2022 from 16.00 – 19.15 CET

Time	Title	Speaker
16.00 – 16.10 (10 min)	**Session Open** • ARS questions	Corey Langer
16.10 – 16.30 (20 min)	**Optimizing First-Line Therapy in NSCLC – Integration of Immunotherapy Into Frontline Regimens** • Optimal use of immunotherapeutic treatment choices in frontline NSCLC	Luis Paz-Ares
16.30 – 16.50 (20 min)	**Current Immunotherapy Options for Relapsed NSCLC** • Optimal use of immunotherapeutic treatment choices in relapsed NSCLC including considerations for potential rechallenge, and treatment selection mono vs combination therapy	Benjamin Besse
16.50 – 17.25 (35 min)	**Tumor Board Discussion** • Case 1 (10 min) • Case 2 (10 min) • Discussion & Q&A (15 min)	Moderator: Solange Peters Francesca Fusco Luis Angel Leon Mateos All faculty
17.25 – 17.35 (10 min)	***Break***	
17.35 – 17.50 (15 min)	**ALK Inhibitors in NSCLC** • Considerations for optimal use in clinical practice in patients with and without brain metastasis	Enriqueta Felip
17.50 – 18.05 (15 min)	**EGFR Inhibitors in NSCLC** • Considerations for optimal use in clinical practice	Johan Vansteenkiste
18.05 – 18.30 (25 min)	**Other Targets in NSCLC** • Considerations for optimal use of ROS1, NTRK, RET and MET inhibitors in clinical practice	Anne-Marie Dingemans
18.30 – 19.05 (35 min)	**Tumor Board Discussion** • Case 1 (10 min) • Case 2 (10 min) • Discussion & Q&A (30 min)	Moderator: Corey Langer May-Lucie Meyer Xander Verbeke All faculty
19.05 – 19.15 (10 min)	**Session Close** • ARS questions	Solange Peters

Question 1

In which country do you currently practice?

1. Austria
2. France
3. Germany
4. Italy
5. Poland
6. Spain
7. The Netherlands
8. United Kingdom
9. Other country in Europe
10. Outside Europe

Question 2

How would you describe your specialty?

1. General oncologist
2. Lung oncologist
3. General internal medicine
4. Pulmonologist
5. Fellow
6. Other

Question 3

In the EMPOWER-Lung 1 trial, cemiplimab showed improvement over chemotherapy in:

1. PFS only
2. OS only
3. PFS and OS
4. Neither

Question 4

70-year-old female, former smoker (25 pk/yrs) presents with stage IIIB NSCLC with LSCN involvement. Cell type is squamous cell carcinoma. PD-L1 level is 60%. Patient completes chemo-XRT with 60 Gy and concurrent weekly paclitaxel/carboplatin with excellent PR on f/u CT imaging, no complications. Which of the following is “approved” consolidation therapy in this setting?

1. Durvalumab
2. Pembrolizumab
3. Atezolizumab
4. Nivolumab

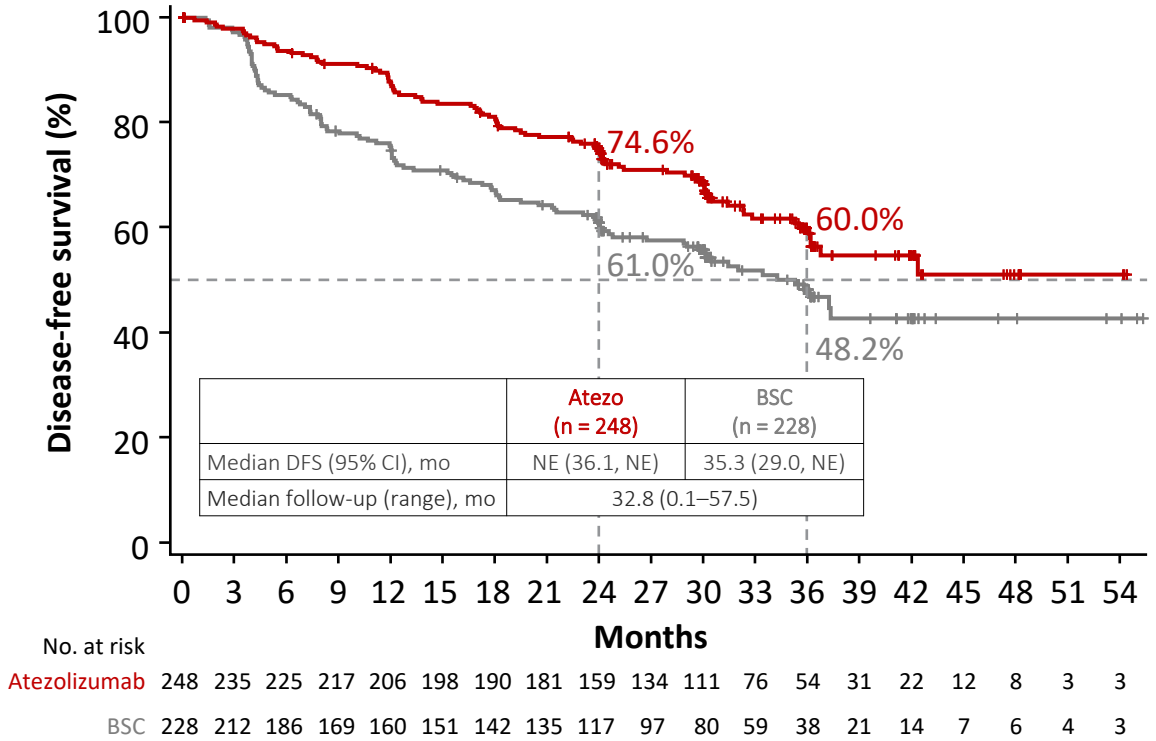
Curable NSCLC: Can We Isolate the Role of Immunotherapy in the Neoadjuvant and Combined Modality Arena?

Exporting CPIs to the Curative Setting

- IMpower010
- CheckMate 816
- NADIM
- PACIFIC

IMpower010: The Primary Endpoint of Improved DFS in Patients With PD-L1 TC ≥1%, Stage II–IIIA* NSCLC Was Met

DFS in PD-L1 TC ≥1%, Stage II–IIIA, Completely resected NSCLC



Primary Analysis Populations

Population analysed for DFS	n	HR (95% CI)§
PD-L1 TC ≥1%, stage II–IIIA	476	0.66 (0.50, 0.88)
All-randomized, stage II–IIIA	882	0.79 (0.64, 0.96)
ITT (all-randomized, stage IB–IIIA)	1005	0.81 (0.67, 0.99)

Endpoint was met at DFS IA

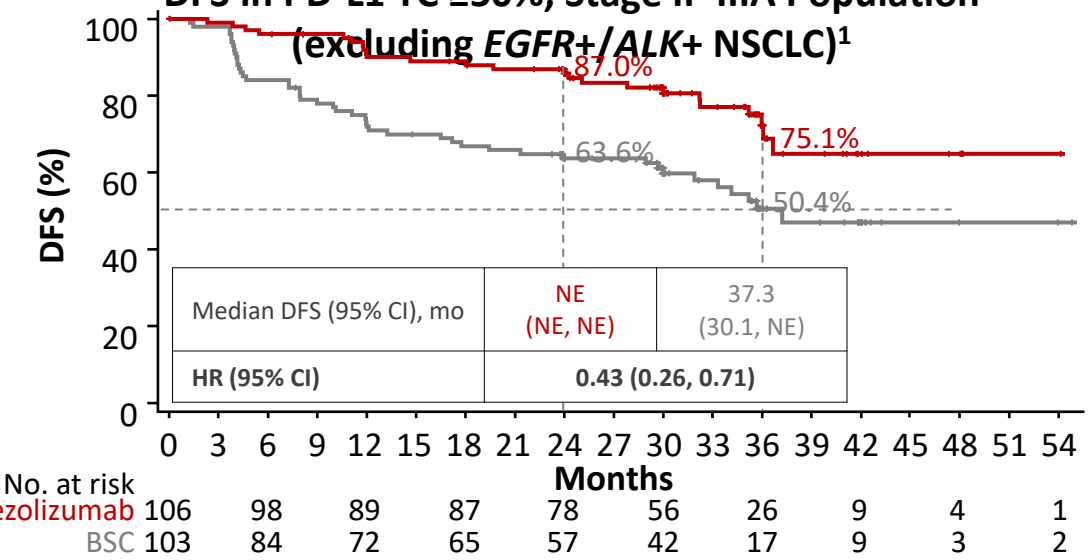
Endpoint was not met at DFS IA, and follow-up is ongoing

***Per *TNM* 7th Edition (select stage II–IIIB per *TNM* 8th Edition).**

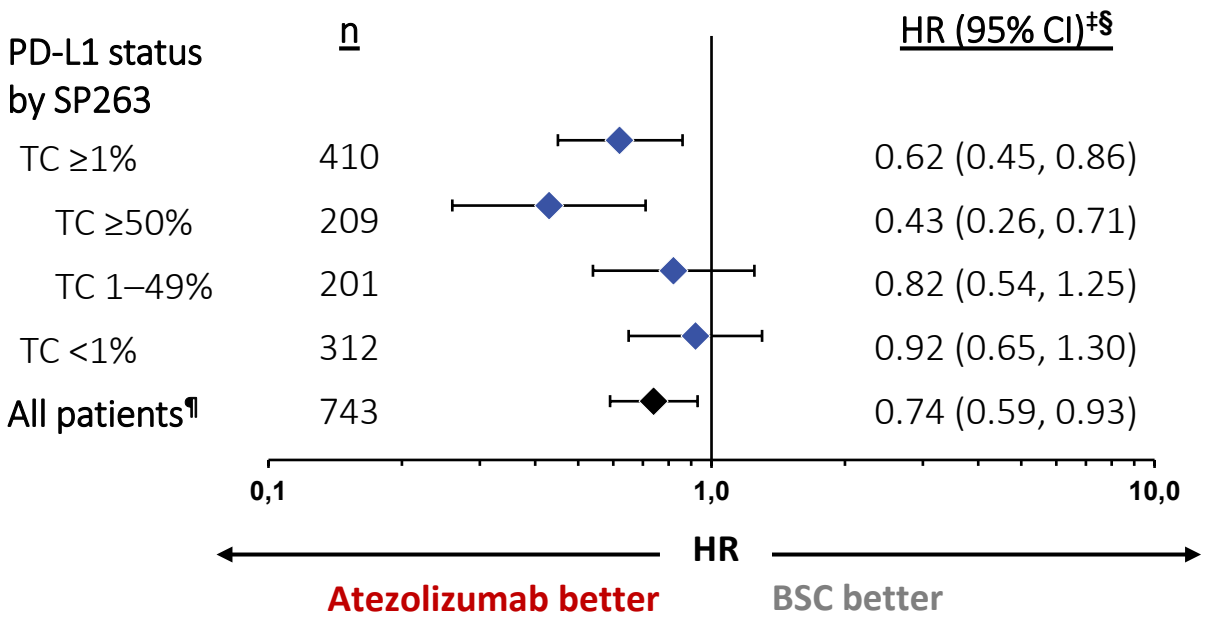
Wakelee H, et al. ASCO 2021. Abstract 8500; Felip E, et al. *Lancet.* 2021;398:1344-1357.

Greatest Magnitude of DFS Benefit With Adjuvant Atezolizumab Over BSC Was in PD-L1 TC ≥50%, Stage II–III NSCLC

DFS in PD-L1 TC ≥50%, Stage II–IIIA Population (excluding *EGFR*+/*ALK*+ NSCLC)[1]



DFS by PD-L1 Status in the All-Randomized, Stage II–IIIA Population (excluding *EGFR*+/*ALK*+ NSCLC)[2]



Clinical cut-off: 21 January 2021.

*Unstratified HR; ‡Stratified for all patients and PD-L1 TC ≥1%; unstratified for all other subgroups; §DFS analyses in the PD-L1 TC <1% and TC 1–49% subgroups were exploratory; ¶23 patients had unknown PD-L1 status as assessed by SP263.

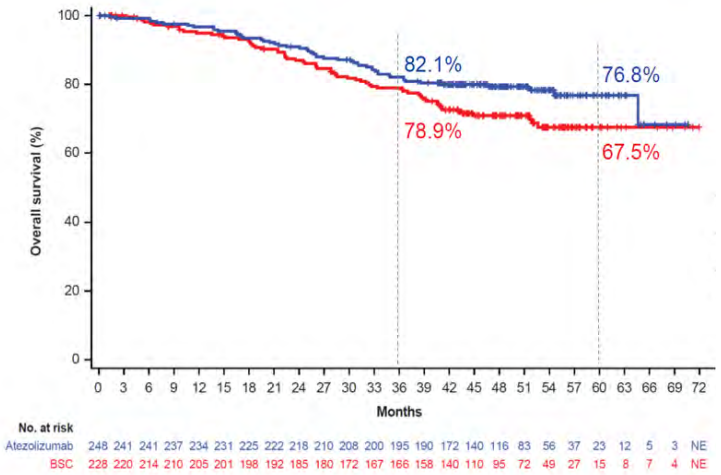
1. Felip E, et al. ELCC 2022. Abstract 800; 2. Felip E, et al. ESMO 2021. Abstract LBA9.

IMpower010: OS Trend of Atezolizumab in PD-L1 ≥1% Stage II–IIIA (interim OS analysis)

No OS Benefit in the All-Randomized Stage II–IIIA

	Atezo (n=442)	BSC (n=440)
Events, n (%)	115 (26.0%)	116 (26.4%)
mOS (95% CI), mo	NR	NR
HR (95% CI)[a]	0.95 (0.74, 1.24)	

OS Interim Analysis in PD-L1 TC ≥1% (stage II–IIIA)



n

	Atezo (n=248)	BSC (n=228)
Events, n (%)	52 (21.0%)	64 (28.1%)
mOS (95% CI), mo	NR	NR
HR (95% CI)[b]	0.71 (0.49, 1.03)	

Clinically Meaningful OS Trend in PD-L1 ≥50%

	Atezo (n=106)	BSC (n=103)
Events, n (%)	15 (14.2%)	30 (29.1%)
mOS (95% CI), mo	NR	NR
HR (95% CI)[d]	0.42 (0.23, 0.78)	

Wakelee H, et al. WCLC 2022. Abstract PL03.09.

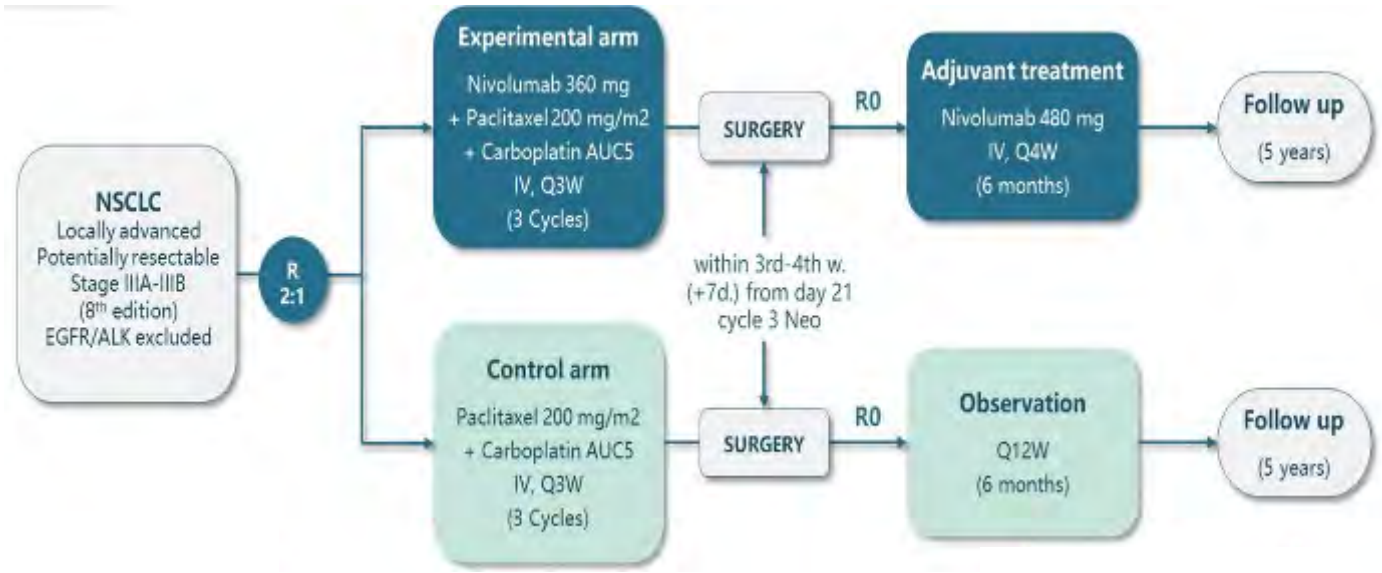
Neoadjuvant Nivolumab: CheckMate 816 and NADIM II

CheckMate 816

Primary Endpoints

- pCR by BICR
- EFS by BICR

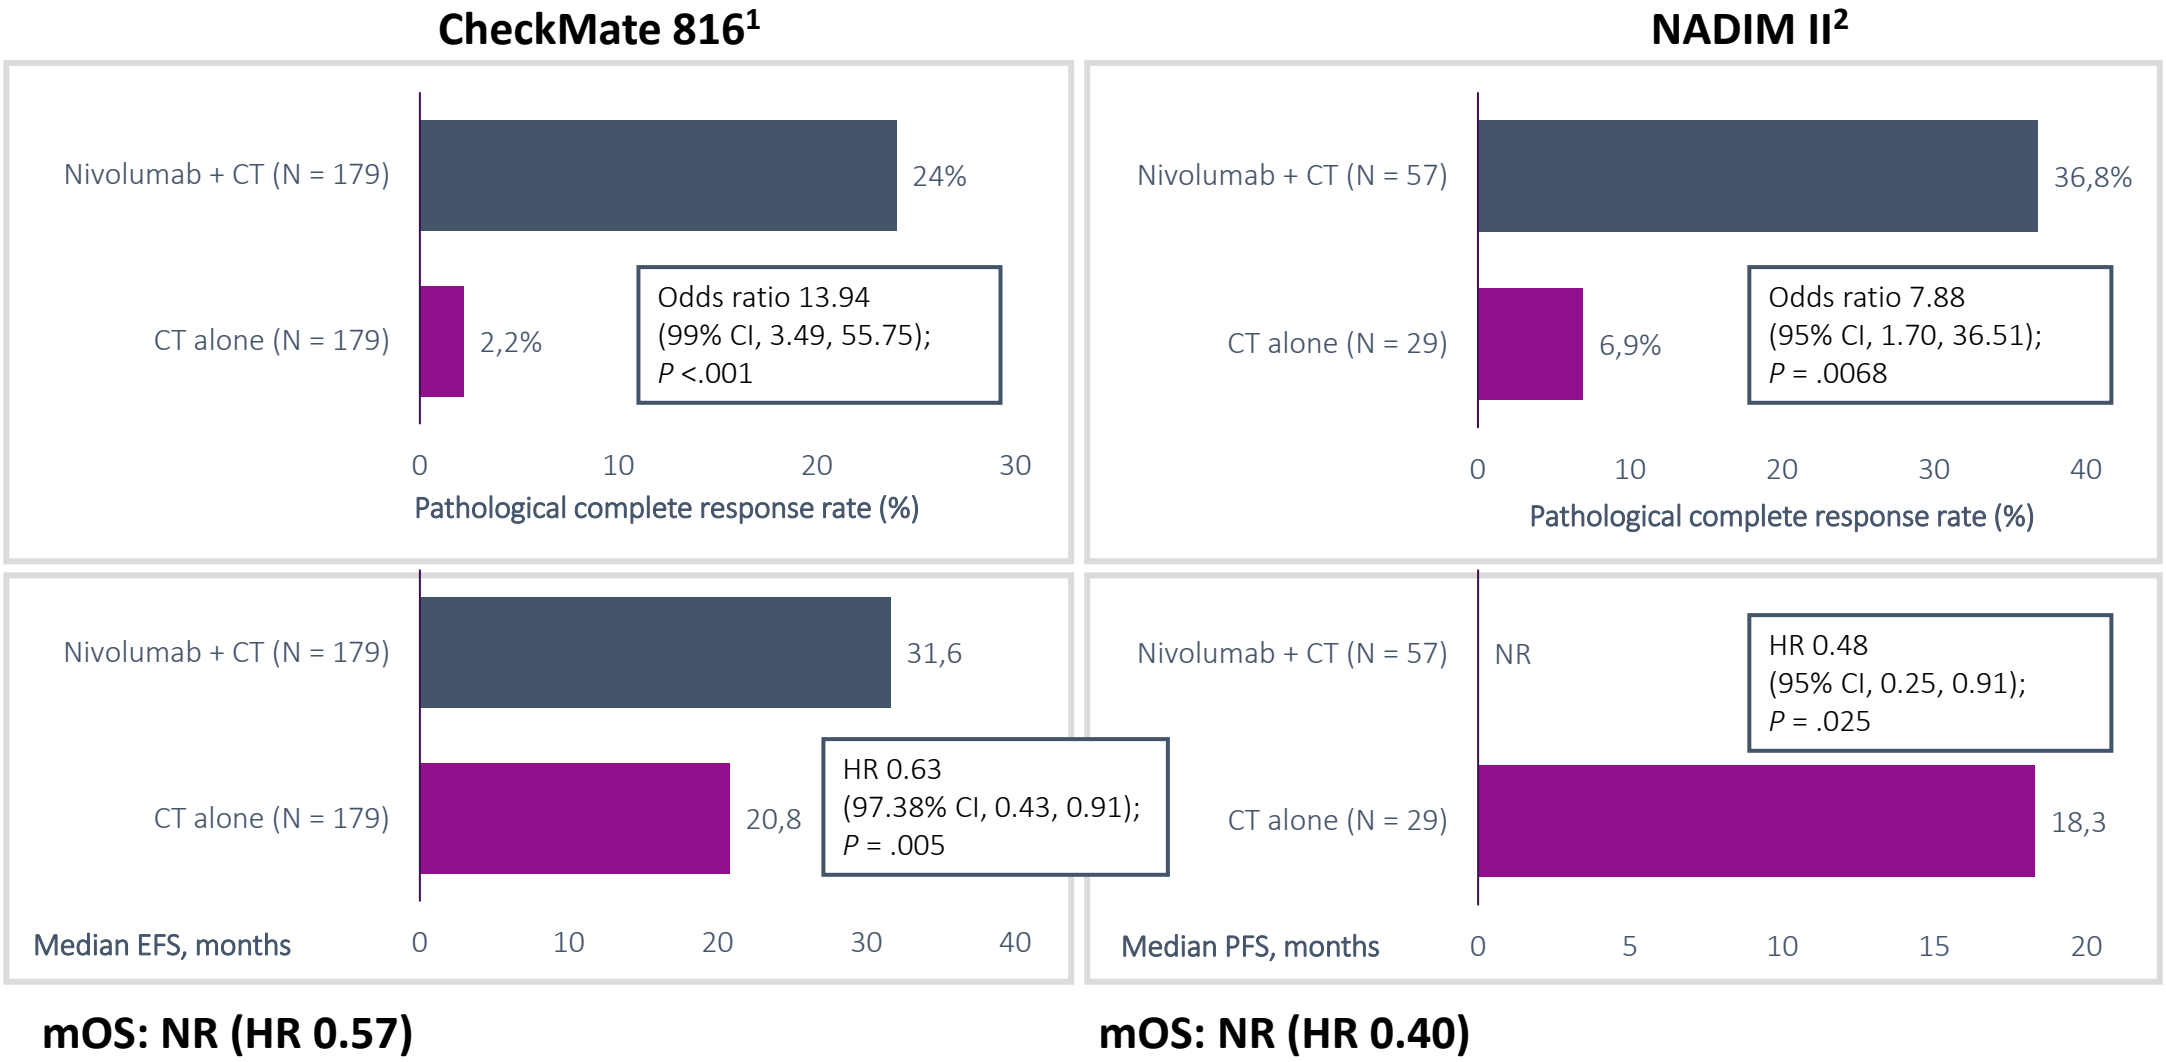
NADIM II



Primary Endpoint

- pCR

Neoadjuvant Nivolumab: Odds Ratio and EFS



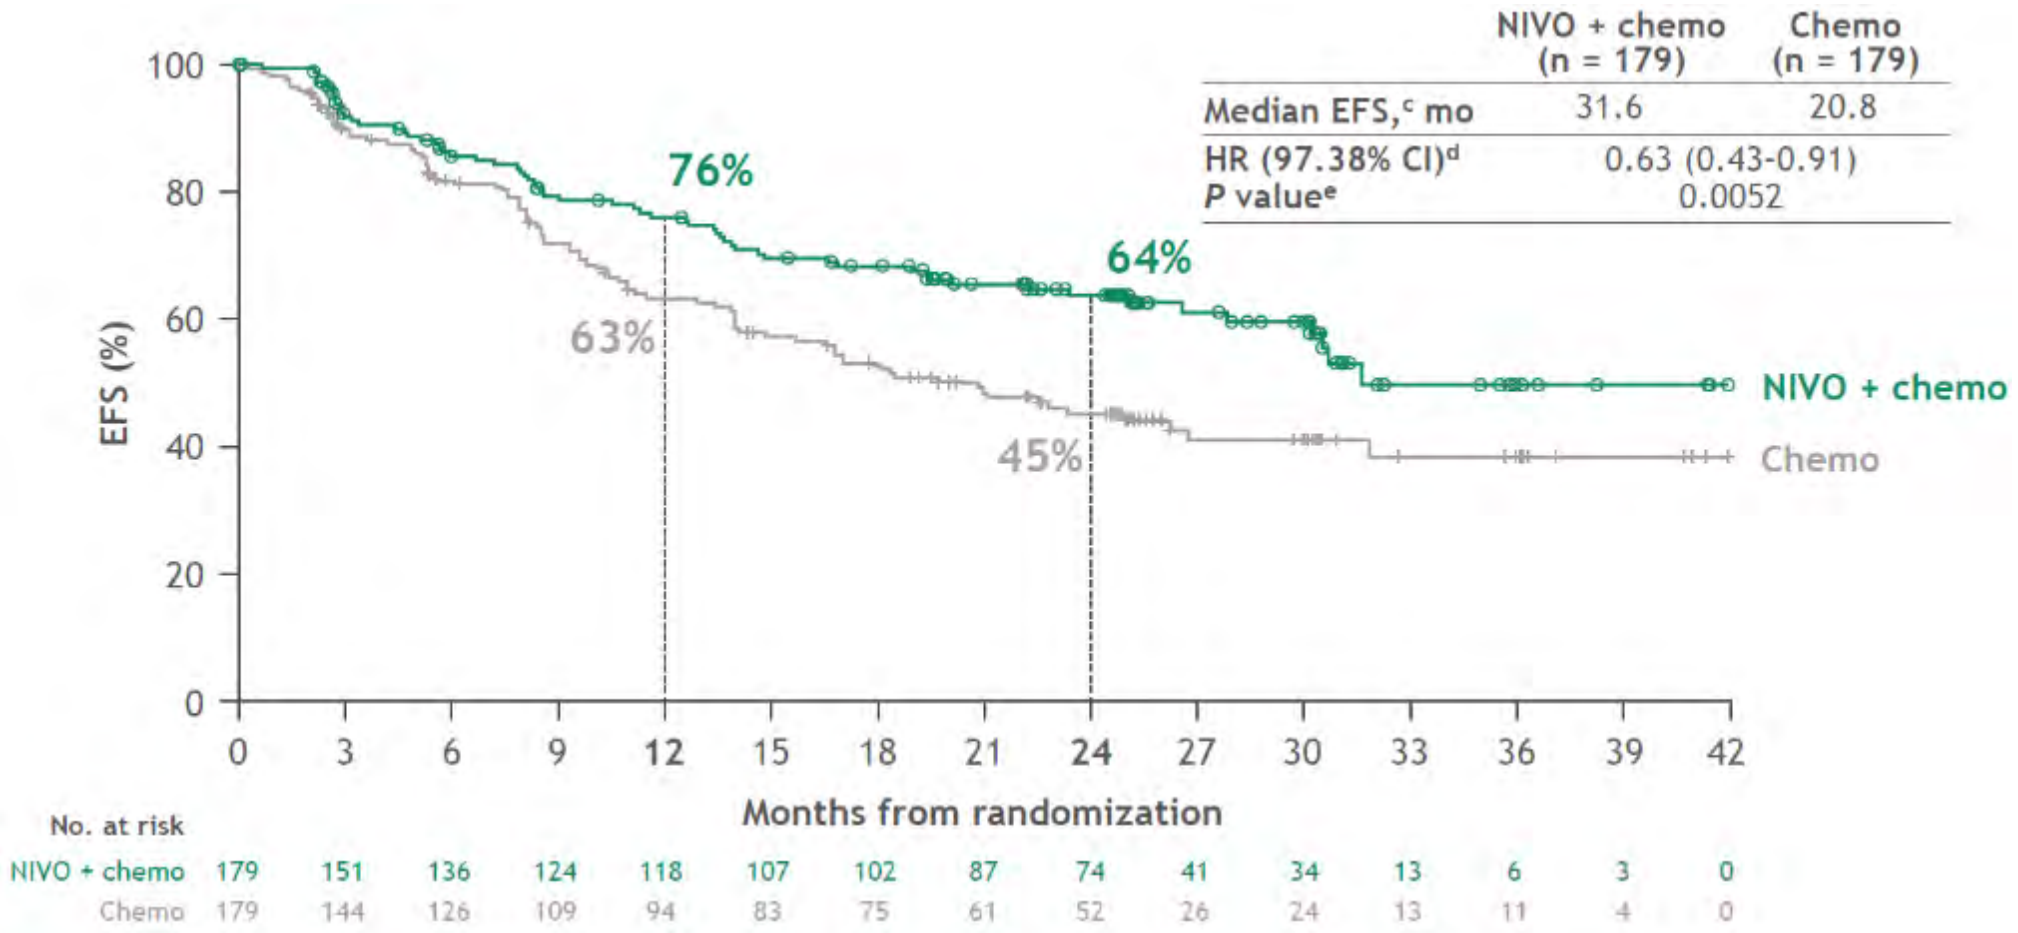
mOS: NR (HR 0.57)

mOS: NR (HR 0.40)

CT, chemotherapy; EFS, event-free survival; HR, hazard ratio; NR, not reached.

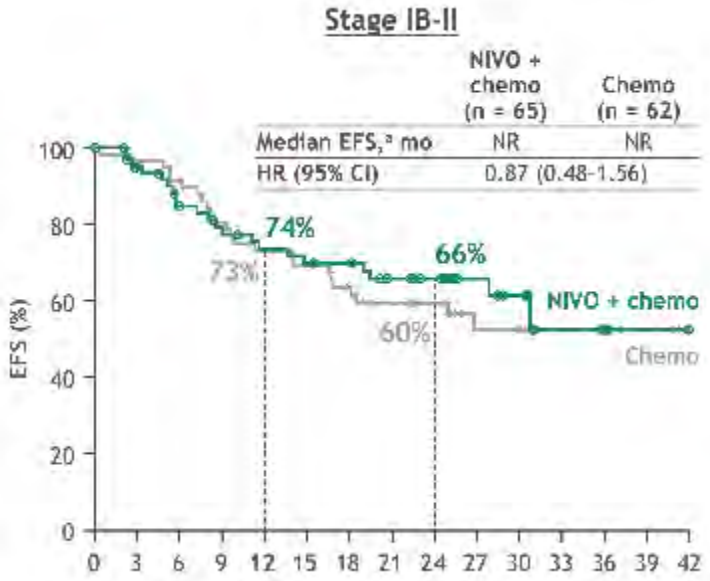
1. Forde PM, et al. *N Engl J Med.* 2018;378:1976-86; 2. Provencio M, et al. ASCO 2022. Abstract 8501.

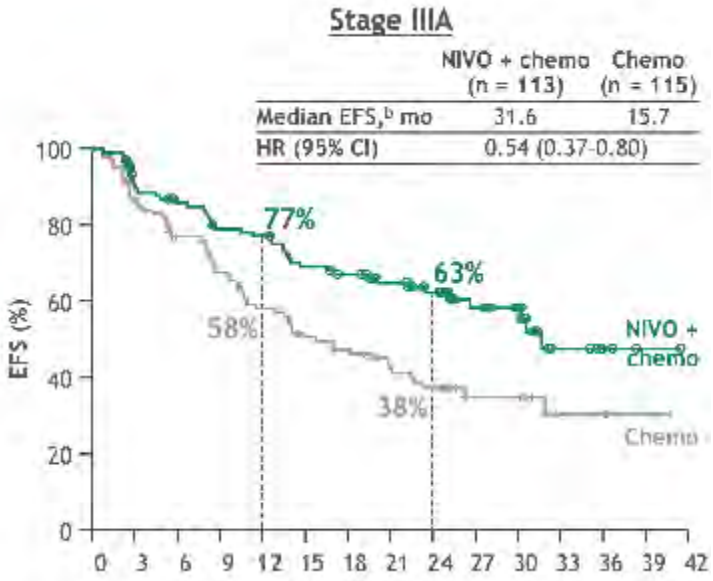
CheckMate 816: Neoadjuvant Nivolumab + Chemotherapy Improved EFS Compared With Chemotherapy Alone

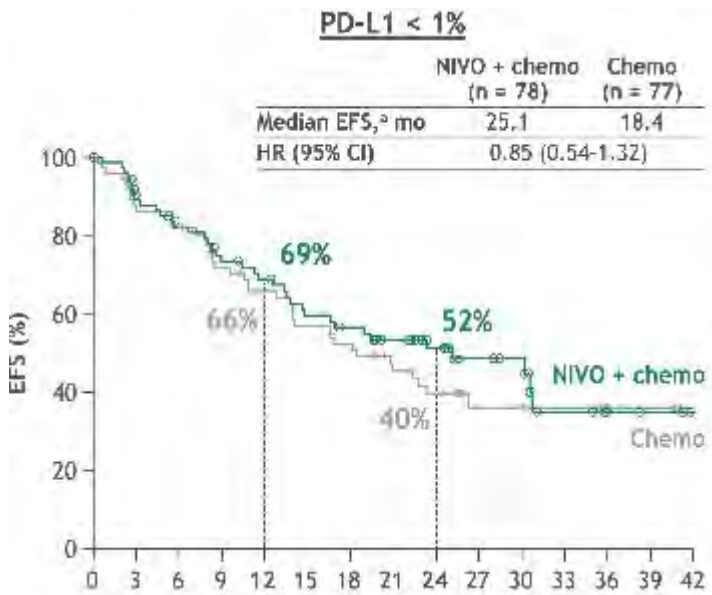


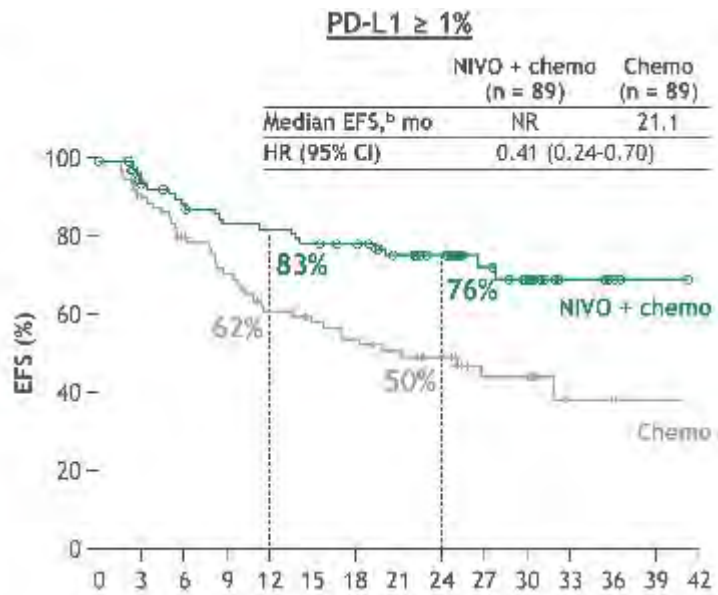
Girard, et al. AACR 2022. Abstract CT012; Forde PM, et al. *N Engl J Med.* 2022;386:1973-1985.

CheckMate 816: An EFS by Stage and PD-L1









NADIM: Secondary Endpoints – Overall Survival

	NIVO + Chemo (n = 57)	Chemo (n = 29)
Median OS (mo)	NR	NR
HR	0.40 (95% CI 0.17–0.93); *P* = .034	

Number at risk

Nivo + chemo	56	56	55	53	37	31	15	5	1	1	1	1	1
Chemo	28	27	25	19	17	13	9	0	0	0	0	0	0

Overall survival was defined as the time from randomization to death. OS was censored on the last date a participant was known to be alive.

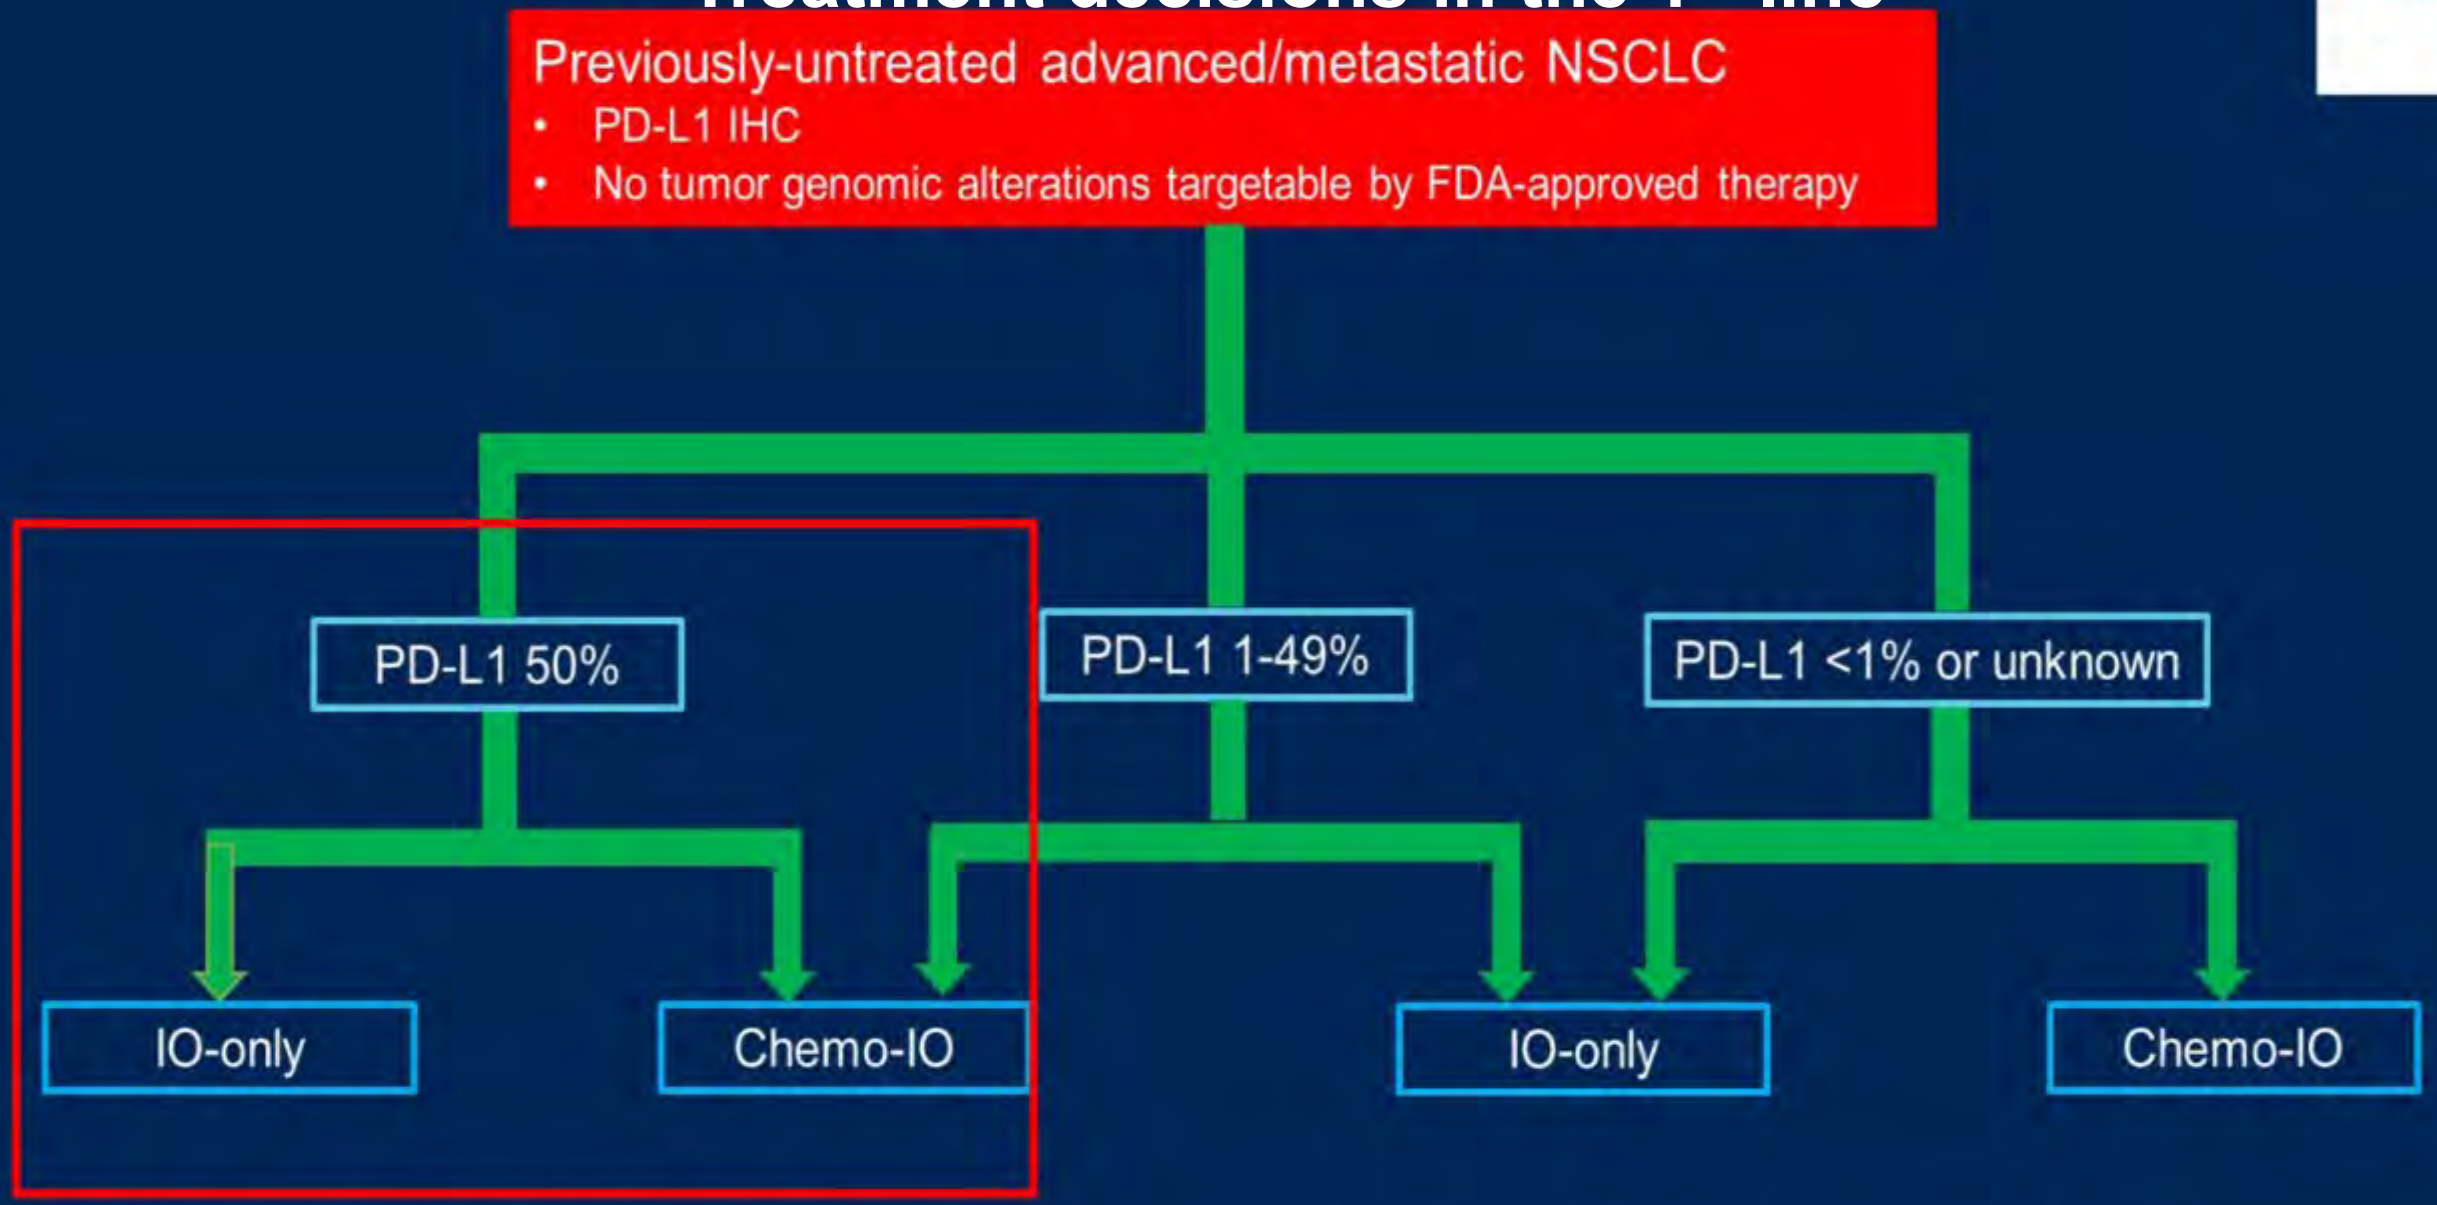
[2]Oncology Center of Excellence, U.S. Food and Drug Administration

Oladimeji Akinboro, MD, MPH

Treatment decisions in the 1st line

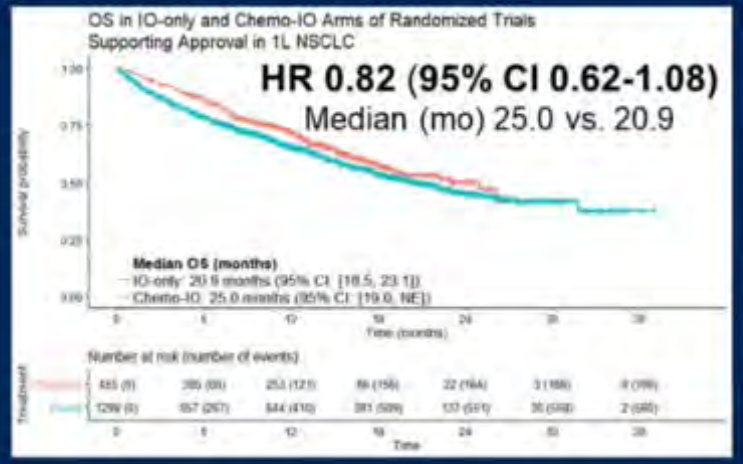


Abbreviations: Chemo-IO=platinum-based doublet chemotherapy plus immunotherapy; IO=immunotherapy; NSCLC=non-small-cell lung cancer; PD-L1=programmed death ligand-1.

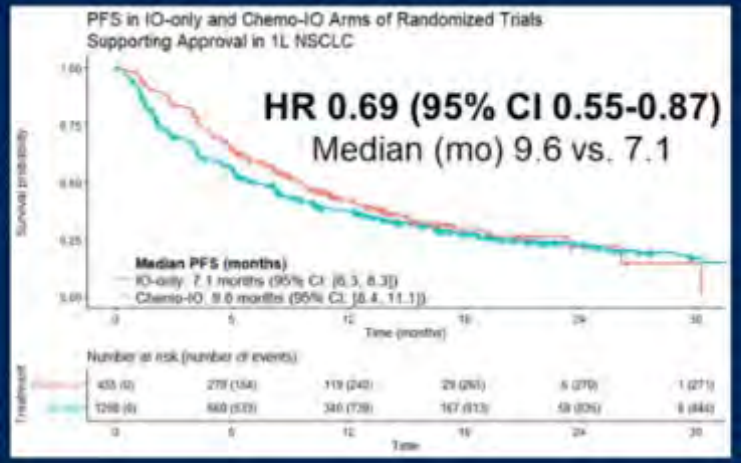
IO vs Chemo-IO in PD-L1 ≥50%

- **Randomized Clinical Trials supporting FDA approved IO-based regimens**
  - **Chemo-IO (6 trials, n=455):** Platinum-Chemo + Pembrolizumab, Atezolizumab (+/- bevacizumab), or Nivolumab/Ipilimumab
  - **IO (6 trials, n=1298):** Nivolumab, Pembrolizumab, Atezolizumab, Cemiplimab, Nivolumab/Ipilimumab
- **Biomarkers[1]: PD-L1 ≥ 50% TPS and *EGFR/ALK* WT**

OS – no difference



PFS – favor chemo-IO



ORR – favor chemo-IO

	Chemo-IO	IO
% (95% CI)	61 (56, 66)	43 (41, 46)
Odds ratio (95% CI)	**1.2** (1.1, 1.3)	

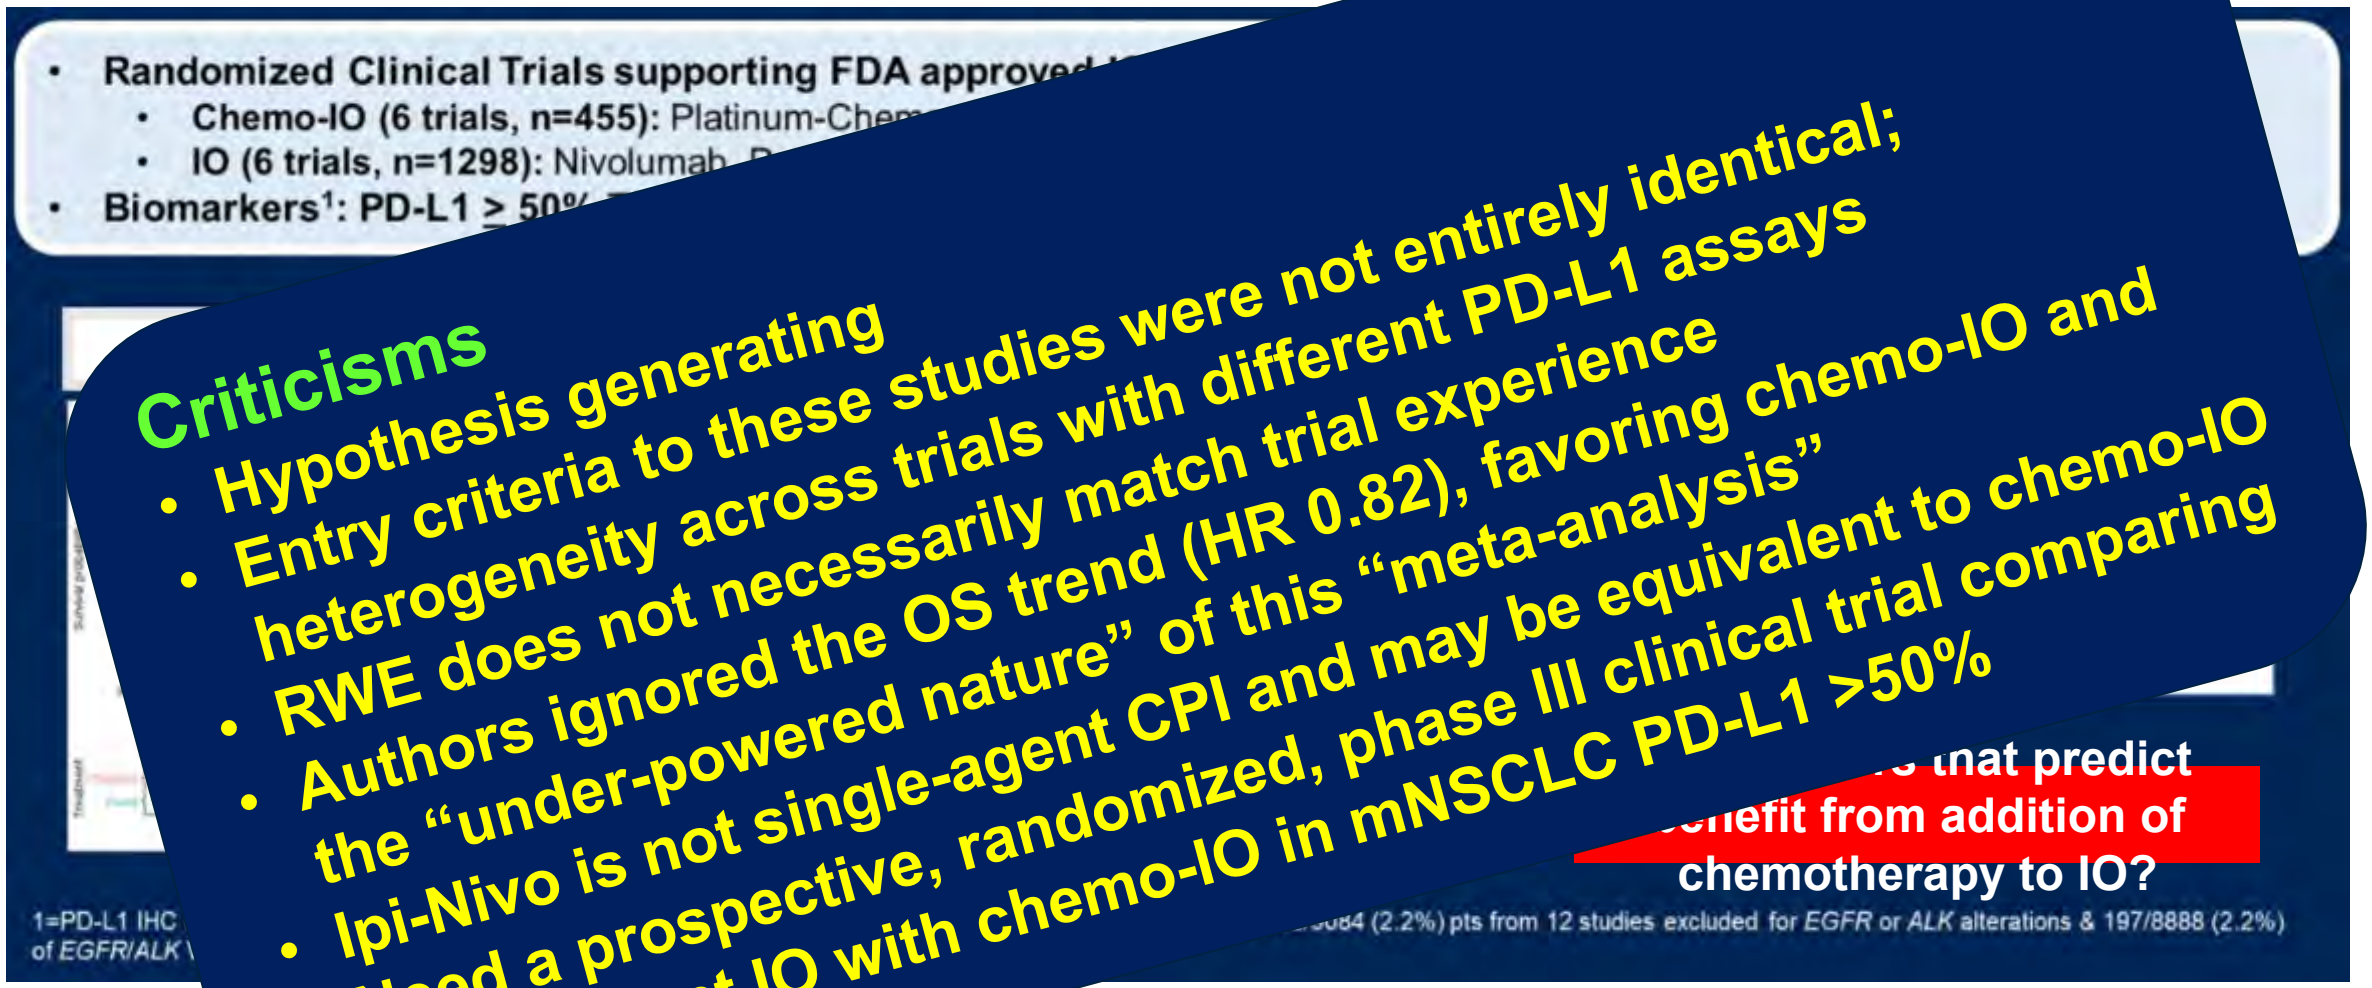
Risk factors that predict benefit from addition of chemotherapy to IO?

1=PD-L1 IHC defined by tumor proportion score (TPS) and excluded staining by tumor infiltrating lymphocytes; 2=196/9084 (2.2%) pts from 12 studies excluded for *EGFR* or *ALK* alterations & 197/8888 (2.2%) of *EGFR/ALK* WT pts excluded as no baseline PD-L1 IHC results.

Adapted from ASCO 2022 presentations by Sukhmani Padda, O. Akinboro.

Penn Medicine Abramson Cancer Center

IO vs Chemo-IO in PD-L1 ≥50%



Criticisms

- Hypothesis generating
- Entry criteria to these studies were not entirely identical; heterogeneity across trials with different PD-L1 assays
- RWE does not necessarily match trial experience
- Authors ignored the OS trend (HR 0.82), favoring chemo-IO and the "under-powered nature" of this "meta-analysis"
- Ipi-Nivo is not single-agent CPI and may be equivalent to chemo-IO
- Need a prospective, randomized, phase III clinical trial comparing single agent IO with chemo-IO in mNSCLC PD-L1 >50%

…that predict …benefit from addition of chemotherapy to IO?

Adapted from ASCO 2022 presentations by Sukhmani Padda, O. Akinboro.

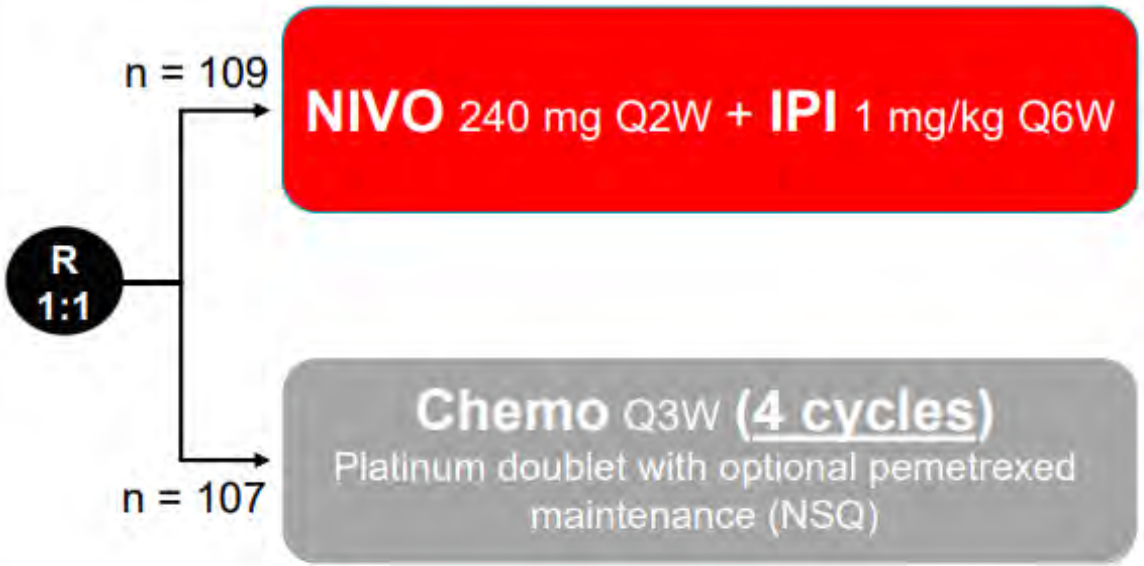
eNerGy : a study dedicated to elderly and PS2 patients

Key Eligibility Criteria

- Stage IV or recurrent
- Squamous or Non-Squamous
- No prior systemic therapy for advanced disease
- No known EGFR mutations or ALK or ROS1 alteration
- Age ≥ 70 ECOG PS 0-1 or PS 2

Stratified by :
· Age ≥ versus < 70 years
· PS 0/1 versus 2
· Histology : squamous/non-squamous



Until disease progression, unacceptable toxicity, *or* for 2 years for immunotherapy

Primary endpoint
- OS

Secondary endpoints
- PFS
- ORR
- Efficacy by tumor PD-L1 expression
- QOL, geriatric mini dataset

Statistical Plan

- 242 patients had to be randomized with 199 events to detect a treatment effect hazard ratio (HR) of 0.65 with 85% power, translating in an improvement of 1-year OS rate from 40% (control arm) to 55% (NIVO-IPI), and using a log-rank test at a 2-sided alpha level of 5%.
- One preplanned interim analysis for futility occurred in December 2019, after that 33% of the expected events have occurred.
- Regarding low effect on PS 2 patients, the DMC recommended to stop inclusion, 217 patients had been randomized at that time.
- Final analysis is performed on the ITT population

Baseline characteristics

	NIVO + IPI (n = 109)	Chemo (n = 107)
Age, median (range), years	74 (52-89)	74 (51-88)
≥ 70	78%	79.4%

TRAEs leading to discontinuation of any component of the regimen	54.3	34.0
TRSAEs	39.0	25.2
Treatment-related deaths	3.8*	1.9**

*Hyperprogression 1 (PS 2, 76 yo), Pneumonitis 1 (PS 0 76 yo), Encephalitis 1 (PS 1 74 yo), sudden death 1 (PS 2 63 yo)

**Septic schock 2 (PS 0 79 yo, PS 1 71 yo)

Conclusion

- In this elderly and/or PS2 advanced NSCLC, we observed a non significant advantage of NIVO IPI compared to platinum doublet chemo for OS, PFS 1 year.
- Nivo-Ipi appeared deleterious for PS2 patients compared to chemo.
- In subgroup analysis of elderly PS 0/1 patients, OS was significantly increased with NIVO IPI over chemo :
  - 22.6 (18.1-36) versus 11.8 (8.9-20.5) months.
- No new signal of toxicity of NIVO IPI in elderly and/or PS2 population was observed
- Pending QOL, geriatric parameters analysis and 2nd line therapies will be presented later.

- **Dedicated trials for elderly population, PS 2 are feasible and remain essential**

Langer's Current Paradigm: 2022 (could change at any moment)

Tx Cohort	Non-squamous	Squamous
PD-L1 ≥50%	Pembro > Pem-Carbo-Pembro	Pembro > Taxane-Carbo-Pembro
PD-L1 1%–50%	Pem-Carbo-Pembro > Pembro	Taxane-Carbo-Pembro > Pembro
PD-L1 <1%	Pem-Carbo-Pembro	Taxane-Carbo-Pembro
PD-L1 <1%, TMB >10	Pem-Carbo-Pembro vs Ipi-Nivo*	Taxane-Carbo-Pembro vs Ipi-Nivo*
TKI refractory	Pem-Carbo ± Bev or Pac-Carbo-Bev-Atezo (IMP150)	
Tissue QNS	Pem-Carbo-Pembro	Taxane-Carbo-Pembro

*Ipilimumab-nivolumab ± 2 cycles of histology-appropriate chemotherapy (9LA).

CPIs: Unanswered Questions for First Line

- Are there biomarkers to aid patient selection beyond PD-L1?
- How to choose monotherapy vs combination?
- Role of CPI combinations vs Pembro-chemo?
  - Need a trial comparing 9LA with Pembro + histology-specific chemo
- **Other unanswered questions**
  - Optimal number of chemo cycles?
  - Can we extend Tx intervals?
  - Maintenance pemetrexed in those with high PD-L1 expression?
  - Mechanisms of resistance?
  - Additional compounds?

Metastatic wtNSCLC: Role of Second-Line Immunotherapy

Association of comprehensive molecular genotyping and overall survival in patients with advanced non-squamous non-small cell lung cancer

Charu Aggarwal, Melina E. Marmarelis, Wei-Ting Hwang, Dylan G. Scholes, Tara L. McWilliams, Aditi P. Singh, Lova Sun, John Kosteva, Michael R. Costello, Roger B. Cohen, Corey J. Langer, Peter E. Gabriel, Lawrence N. Shulman, Jeffrey C. Thompson, Erica L. Carpenter

Abramson Cancer Center,
University of Pennsylvania
Philadelphia, PA, United States

Background/Methods:

- We analyzed the impact of concurrent tissue (T) and plasma (P) based next generation sequencing (NGS) upon comprehensiveness of molecular genotyping and overall survival (OS).

Methods:

- Retrospective cohort study of patients with newly diagnosed Stage IV non-squamous NSCLC treated at our institution between 1/2019 -12/2020
- Categories of NCCN guideline concordant testing were defined as follows:
  i. Comprehensive: *EGFR, ALK, BRAF, ROS1, MET, RET, NTRK* testing
  ii. Incomplete: 2-6 genes tested
  iii. No molecular testing

Statistics:

- Proportion of patients with comprehensive molecular testing performed, prior to first line and by modality (T NGS vs. T+P NGS), were compared using Fisher's exact test.
- Median OS was estimated using Kaplan-Meier methodology from diagnosis to death or censored at most recent follow-up.

Figure 1. Consort Diagram

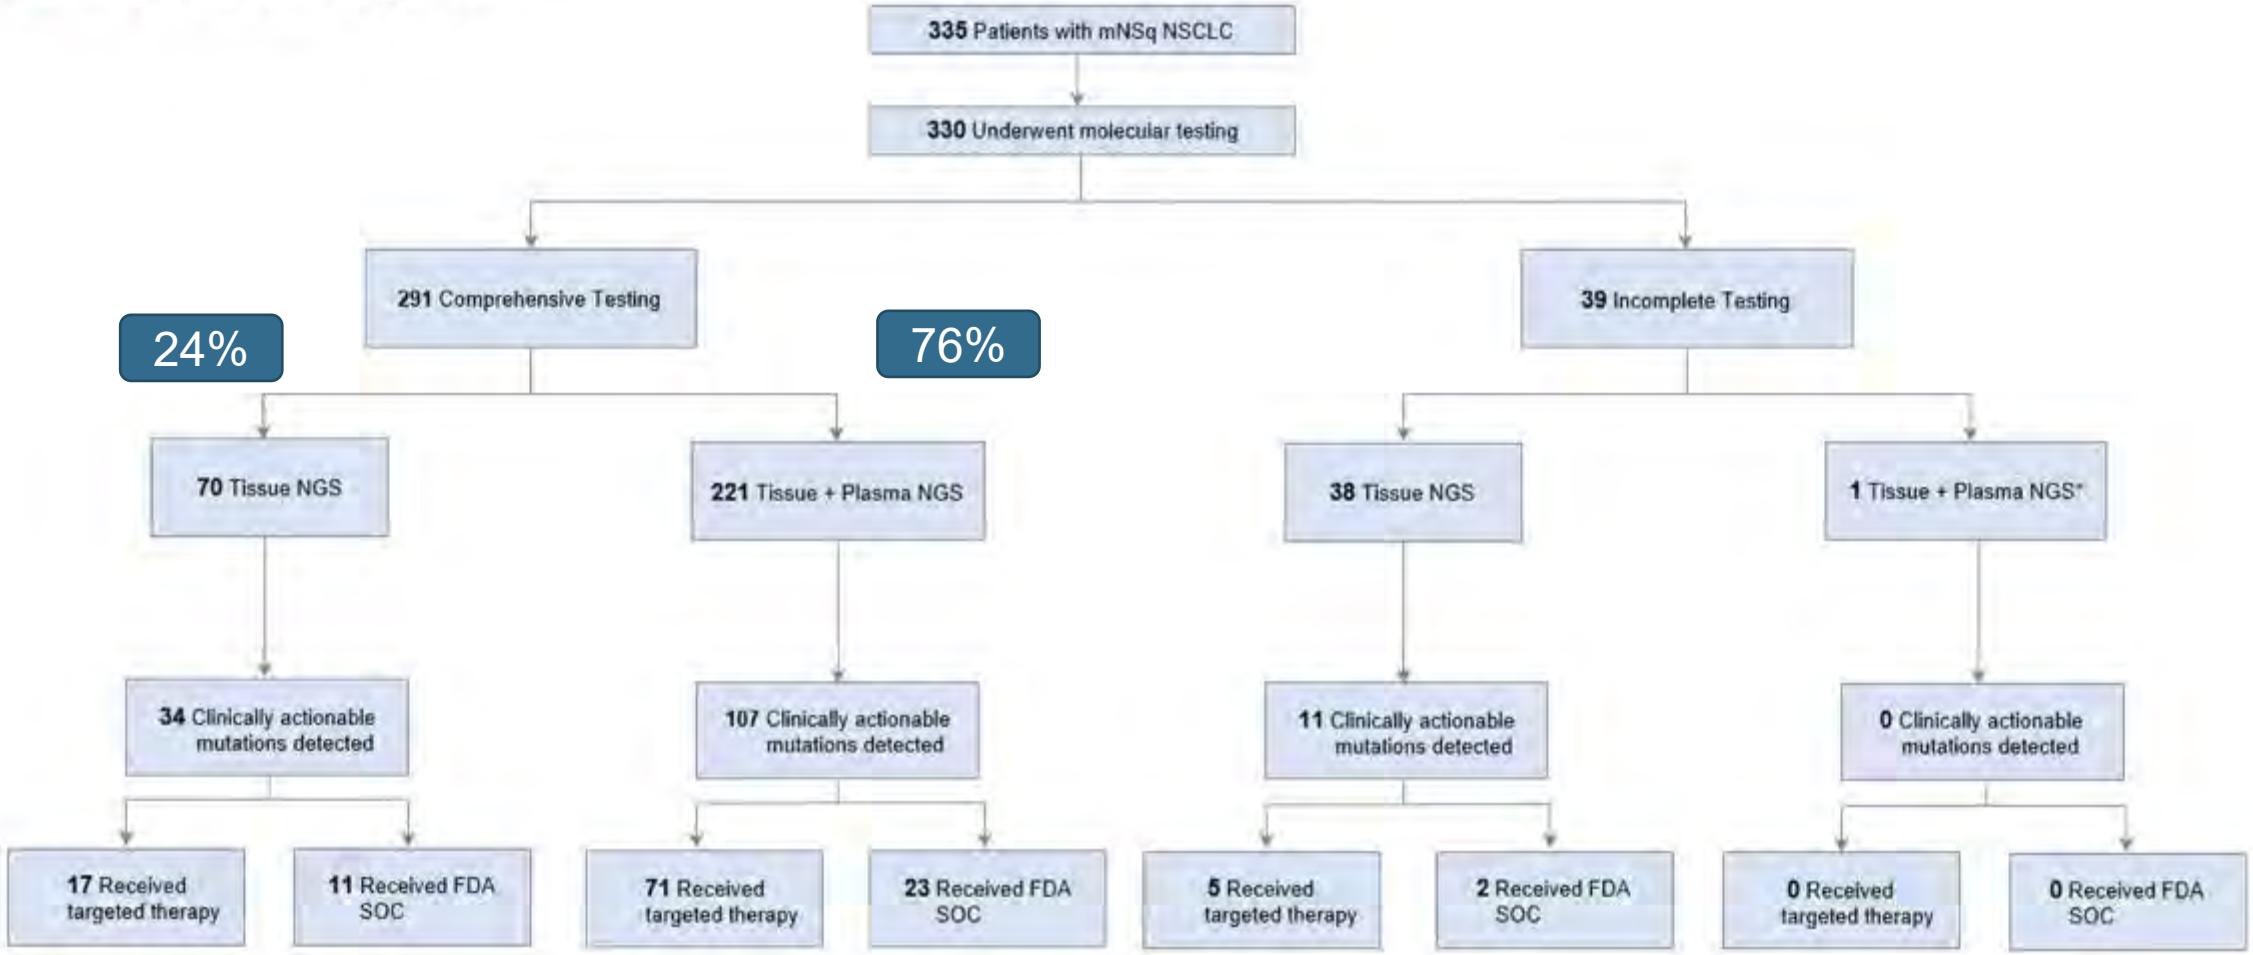

Fig 1.
Flowchart summarizes the overall patient enrollment and the number of clinically actionable mutations detected (*EGFR, ALK, BRAF, ROS1, MET, RET, NTRK1,2* and *3, KRAS* G12C, and *ErbB2)* on Tissue vs. Tissue + Plasma NGS for patients with comprehensive testing as well as for those with incomplete/no testing. NGS, next-generation sequencing; FDA, Food and Drug Administration; SOC, standard of care.

Comprehensive molecular genotyping and overall survival

Patients with comprehensive molecular genotyping had superior OS (22.1 months, 95% CI 14.62 – NA), compared to those with incomplete or no testing (11.6 months, 95% CI 3.61 – NA), p=0.02, likely mediated by delivery of targeted therapy

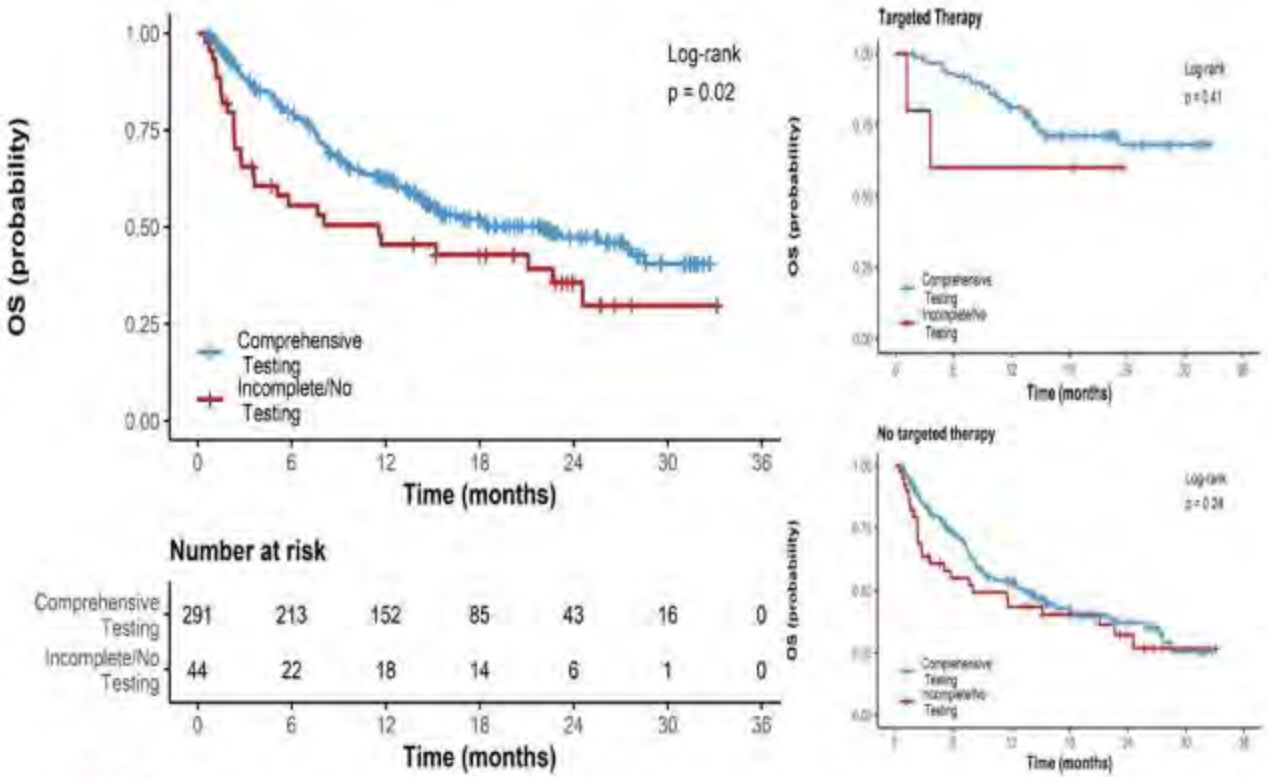

Fig 1.
Kaplan-Meier curve for OS of patients with comprehensive testing compared to patients with incomplete/no testing.

Availability of molecular genotyping results prior to first line therapy was associated with an improvement in OS (24.57 months, 95% CI, 18.56– NR), compared to patients without results available prior to first line therapy (6.18 months, 95% CI, 2.83 – 10.3), p<0.0001

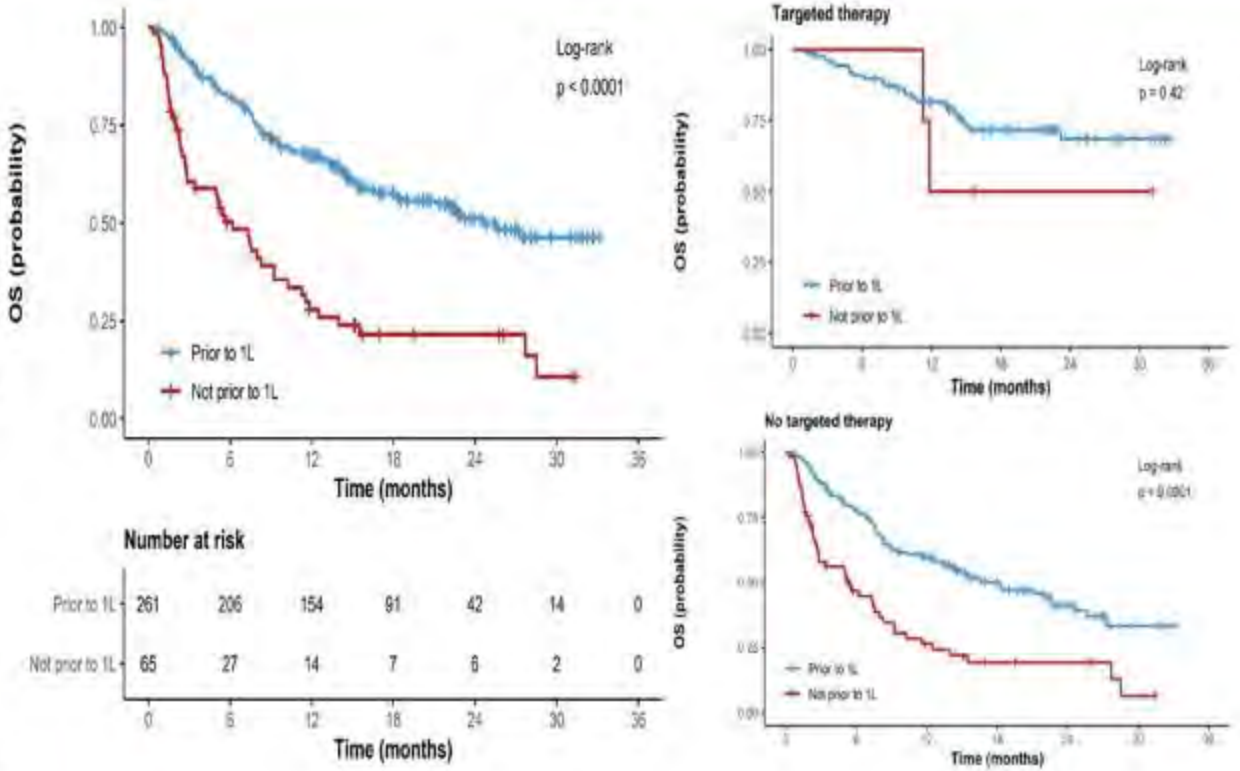

Fig 2.
Kaplan-Meier curve for OS of patients with comprehensive testing back prior to first line treatment compared to patients with results not back prior to first line treatment.

NGS: Implications for Clinical Practice

Tissue for NGS testing

- Should be obtained, if safe and feasible, both at diagnosis as well as at progression after primary targeted therapy
- At a minimum, test all adenocarcinomas regardless of smoking history, all never smokers or remote, former smokers regardless of histology

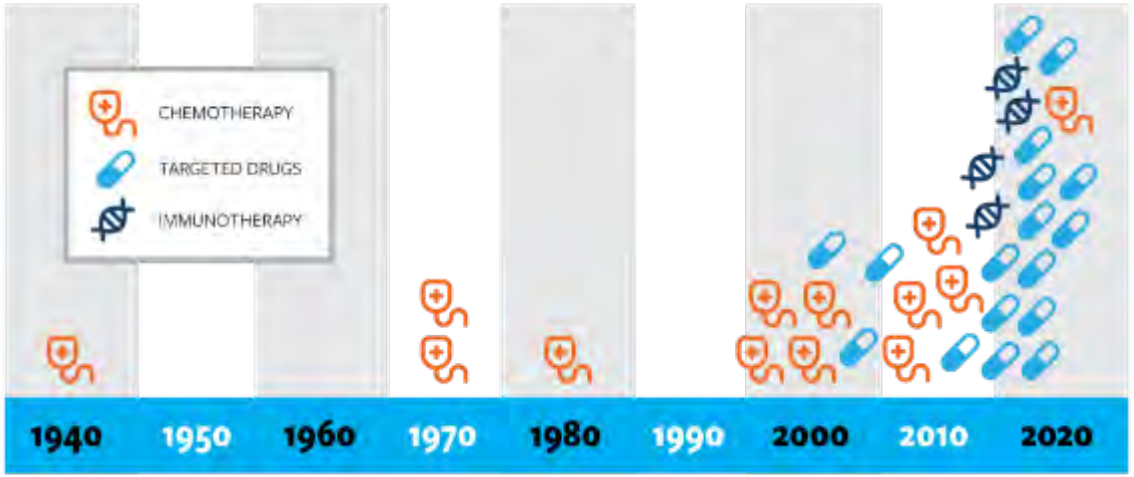
Liquid biopsy for NGS testing

- Obtainable at diagnosis, often concurrently with tissue testing; quick TAT
- Especially useful if burden of disease is on the higher side
- May be negative, especially if disease burden is low or confined to the thorax
- Early institution, in conjunction with standard tissue testing, can lead to improved outcome
- Often useful in detecting mechanisms of resistance after primary TKI therapy
- Evolving role in monitoring efficacy of therapy, both in the neoadjuvant setting and in advanced NSCLC

KRAS-Targeted Therapy: Beyond Sotorasib

KRAS G12C

- *KRAS* mutations are prevalent in NSCLC
- *KRAS* G12C present in 13% of lung adenocarcinoma
- Previously undruggable due to protein shape
- **NOW** with an FDA-approved targeted therapy and others in development



2021
Mobocertinib – *EGFR* exon20
Sotorasib – *KRAS* G12C
Amivantamab – *EGFR* exon 20
Tepotinib – *MET* exon 14 skipping

2020
Pralsetinib – *RET*
Brigatinib – *ALK* 1L
Capmatinib – *MET* exon 14 skipping
Selpercatinib – *RET*

2019
Entrectinib – *NTRK*, *ROS1* fusions

2018
Lorlatinib – *ALK*
Larotrectinib – *NTRK* fusion
Dacomitinib – *EGFR*

Progression-Free Survival

Sotorasib
ORR 37.1%

CodeBreaK 200 Phase 3 Study Design

Key eligibility criteria

- Locally advanced/unresectable or metastatic *KRAS* G12C-mutated NSCLC
- **≥ 1 prior treatment including platinum-based chemotherapy and checkpoint inhibitor***
- **No active brain metastases**
- ECOG performance status ≤ 1

Stratification factors

- Prior lines of therapy (1 vs 2 vs > 2)
- Race (Asian vs non-Asian)
- History of CNS involvement (yes vs no)

Randomisation 1:1 (N = 345)

- **Sotorasib 960 mg oral daily N = 171**
- **Docetaxel 75 mg/m² IV Q3W N = 174**

Primary Endpoint: PFS by BICR

Secondary Endpoints: Efficacy (OS†, ORR, DOR, TTR, DCR)**, safety/tolerability, PRO**

ITT population analysis included all randomised patients

Per regulatory guidance, protocol was amended to reduce planned enrolment from 650 to ~330 patients, and crossover from docetaxel to sotorasib was permitted.

Enrollment period: June 4, 2020 to April 26, 2021; protocol amendment: February 15, 2021; data cutoff: August 2, 2022.

NCT04303780; EudraCT: 2019-003582-18.

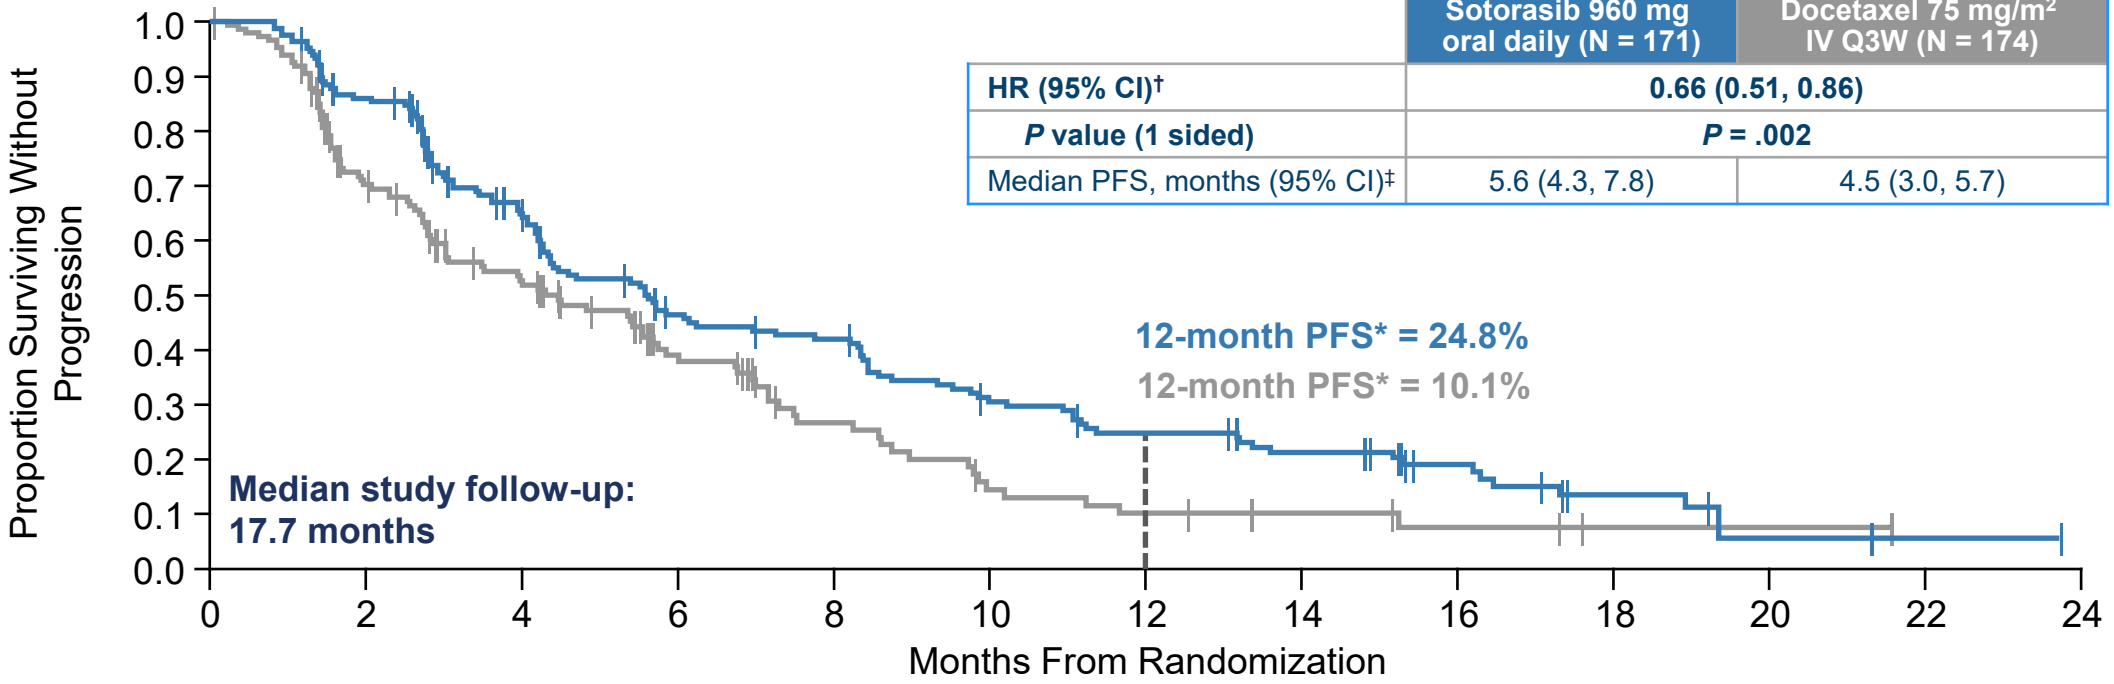
*Treatment with chemotherapy and checkpoint inhibitor could be concurrent or sequential; patients with medical contraindication to these therapies could be included with approval.

†Analysis of OS planned if PFS was found to be statistically significant and when at least 198 OS events have been reached.

Melissa L. Johnson, MD
Twitter: @MLJohnsonMD2

Primary Endpoint: PFS by BICR

	Sotorasib 960 mg oral daily (N = 171)	Docetaxel 75 mg/m² IV Q3W (N = 174)
HR (95% CI)†	0.66 (0.51, 0.86)	
P value (1 sided)	*P* = .002	
Median PFS, months (95% CI)‡	5.6 (4.3, 7.8)	4.5 (3.0, 5.7)



Number of Patients at Risk:

Sotorasib	171	139	93	63	56	38	30	24	14	6	2	1	0
Docetaxel	174	93	62	36	20	10	7	5	3	1	1	0	

CodeBreaK 200 met its primary endpoint with sotorasib demonstrating superior PFS over docetaxel (HR 0.66, *P* = .002); 12-month PFS rate was 24.8% for sotorasib and 10.1% for docetaxel

*PFS rates estimated using Kaplan-Meier method; ITT population.
†HR and 95% CIs estimated using a stratified Cox proportional hazards model; *P* value calculated using a stratified log-rank test.
‡Medians estimated using Kaplan-Meier method; 95% CIs estimated using the method by Klein and Moeschberger with log-log transformation.

Key Takeaways From 2021–2022 in Lung Cancer

- **Neoadjuvant:** chemo-Nivo superior pCR, MPR, and EFS vs chemo alone in resectable IB–IIIA NSCLC
- **Adjuvant:** post-resection and adjuvant chemo, atezolizumab yields superior DFS in stage II/IIIA, PD-L1–positive NSCLC and potential OS advantage in pts with ≥50% expression. Pembro yields similar PFS benefit in phase III trial
- **LA-NSCLC:** durvalumab post chemo-XRT remains SOC in absence of PD or untoward toxicity
- **PD-L1 ≥50%:** still on the hunt for high-risk features that predict benefit of adding chemo to IO
  - Ongoing research will prospectively define role of chemo-IO vs IO alone
- **Combination CPIs:** hazardous in PS 2, but fit elderly appear to benefit (vs chemo alone)
  - Trials intermixing these populations will lead to “murky” outcomes
- **Second-line treatment:** post–chemo-IO space poses tremendous, unmet need
  - IO + VEGF may be a viable, less-toxic strategy compared with other options in this space (eg, docetaxel ± Ramu)
- ***KRAS* G12C**: adagrasib will likely be the next addition in the therapeutic portfolio
  - Similar to sotorasib in efficacy but has higher grade 3–4 TRAEs that may require dose reduction
  - However, documented CNS penetrance

ABSTRACT

The discovery of oncogenic driver mutations rendering non-small cell lung cancer (NSCLC) targetable by small-molecule inhibitors, and the development of immunotherapies, have revolutionised NSCLC treatment. Today, instead of non-selective chemotherapies, all patients with advanced NSCLC eligible for treatment (and increasing numbers with earlier, less extensive disease) require fast and comp treatment.

The discovery of oncogenic driver mutations rendering non-small cell lung cancer (NSCLC) targetable by small-molecule inhibitors, and the development of immunotherapies, have revolutionised NSCLC treatment. Today, instead of non-selective chemotherapies, all patients with advanced NSCLC eligible for treatment (and increasing numbers with earlier, less extensive disease) require fast and comprehensive screening of biomarkers for first-line patient selection for targeted therapy, chemotherapy, or immunotherapy (with or without chemotherapy). To avoid unnecessary re-biopsies, biomarker screening before first-line treatment should also include markers that are actionable from second-line onwards; PD-L1 expression testing is also mandatory before initiating treatment.

Population differences exist in the frequency of oncogenic driver mutations: *EGFR* mutations are more frequent in Asia than Europe, whereas the converse is true for *KRAS* mutations. In addition to approved first-line

BACKGROUND: Immune-checkpoint inhibitors (ICIs) represent an important treatment option for patients who have advanced stage non–small cell lung cancer (NSCLC). Currently, evaluation of the expression level of programmed death-ligand 1 (PD-L1) has proven highly successful as a positive predictive biomarker for ICIs. In addition to PD-L1, other promising predictive biomarkers are emerging, including high tumor mutational burden (TMB-H). However, measuring TMB-H remains challenging for several reasons, among which is the difficulty in obtaining adequate tissue material from NSCLC patients. There are no data in the current literature regarding the possibility of adopting cell blocks (CBs) for TMB evaluation; therefore, our goal was to evaluate the feasibility of analyzing TMB on CBs. **METHODS:** For evaluation of differences in run metric parameters, 8 pairs of histological and CB samples from patients with NSCLC were analyzed using the Oncomine Tumor Mutational Load Assay on Ion Torrent S5 GS next-generation sequencing (NGS) platform. **RESULTS:** Most CBs (6/8, 75.0%) were successfully analyzed by adopting the broad NGS panel approach. CBs provided results similar to those obtained on histological matched specimens in terms of median total reads (7207048.80 vs 7558817.80), median mapped reads (7075753.83 vs 7513822.00), median read lengths (115.50 vs. 113.00), median percentage of reads on-target (97.49% vs 98.45%), median average reads per amplicon (454.67 vs 476.14), and median uniformity of amplicon coverage (83.52% vs 84.13%). **CONCLUSION:** In this pilot study, we demonstrated the technical feasibility of assessing TMB on CBs. ***Cancer Cytopathol* 2020;0:1-8**. © *2020 American Cancer Society*

Dana-Farber Cancer Institute, Boston, MA; AstraZeneca, Cambridge, United Kingdom; Quantitative Clinical Pharmacology, Early Clinical Development, IMED Biotech Unit, AstraZeneca, Cambridge, United Kingdom; AstraZeneca, Waltham, MA; Samsung Medical Center, Seoul, South Korea

"Eligible patients will have histologically/cytologically confirmed *EGFR*-mutant NSCLC, and *MET*+ disease by central FISH, central IHC, or local NGS (retrospectively confirmed by central FISH/IHC)."

"Combination with a MET inhibitor is an intuitive approach as *MET* amplification was identified as the most common mechanism of resistance to osimertinib in preliminary ctDNA data from the phase III FLAURA (15% of pts) and AURA3 (19% of pts) studies."

Considering SAVANNAH results

- *MET* amplification, identified by FISH, remains the optimal biomarker to identify suitable candidates for MET TKI therapy
- The prevalence of *MET* overexpression and/or amplification in patients centrally tested for enrolment to SAVANNAH was 34% using the high cutoffs
- High *MET* levels, as detected by IHC and FISH, seem to predict efficacy to osimertinib + savolitinib using SAVANNAH data

Early-Stage and Locally Advanced (nonmetastatic) NSCLC: ESMO Clinical Practice Guidelines

Adjuvant ChT Recommendations

- Adjuvant ChT should be offered to patients with resected TNM 8th edition stage IIB and III NSCLC [I, A] and can be considered in patients with T2bN0, stage IIA resected primary tumor >4 cm [II, B]
- For adjuvant ChT, a 2-drug combination with cisplatin is preferable [I, A]. In randomized studies, the attempted cumulative cisplatin dose was up to 300 mg/m^2, delivered in 3–4 cycles
- When cisplatin administration is not feasible, carboplatin is an accepted alternative [IV, B]

Postoperative Radiotherapy Recommendations

- PORT in completely resected early-stage I–IIIA NSCLC is not recommended [I, E]

Icotinib versus chemotherapy as adjuvant treatment for stage II–IIIA EGFR-mutant NSCLC (EVIDENCE): a randomized, open-label, phase 3 study

Dr. Caicun Zhou

Shanghai Pulmonary Hospital & Thoracic Cancer Institute, Tongji University School of Medicine, Shanghai, China

- Patients with completely resected stage II-IIIA NSCLC
- Primary NSCLC with *EGFR* ex19del or L858R
- Aged ≥ 18 yrs and < 70 yrs
- ECOG PS 0-1
- N=322

1:1

Icotinib 125mg TID for 2 yrs N=161

Stratified by stage (II vs. IIIA), EGFR mutation (ex19del vs. L858R), resection methods (lobectomy vs. pneumonectomy)

NP or PP for 4 cycles* N=161

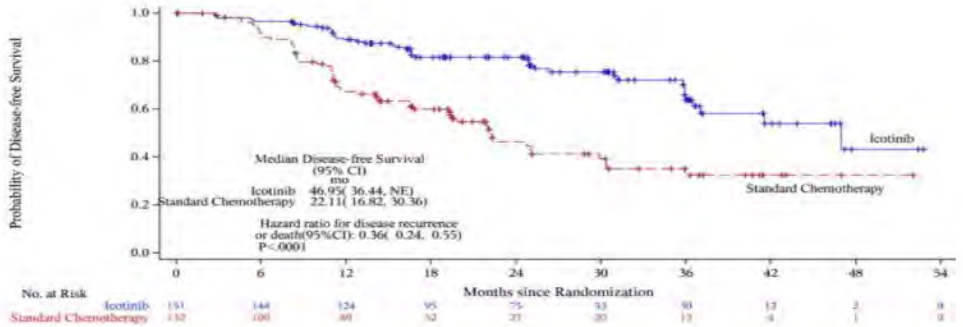
*cisplatin plus vinorelbine for adenocarcinoma or squamous carcinoma, cisplatin plus pemetrexed for non-squamous carcinoma

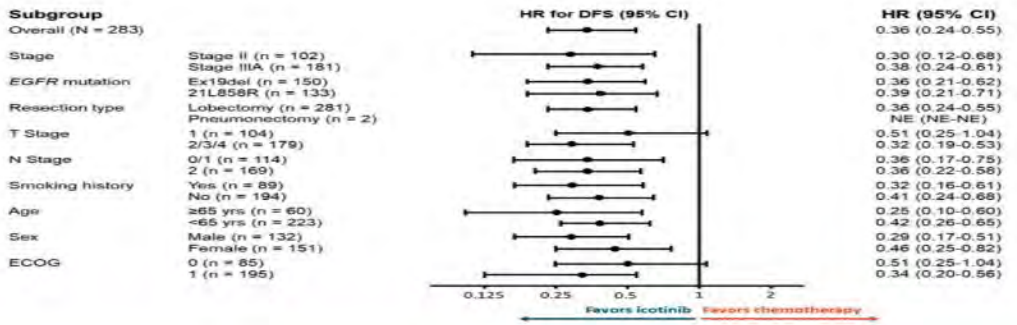
- Primary endpoint: DFS
- Secondary endpoints: DFS rates at Yrs 3, and 5; OS; safety
- Data cutoff: 31st Mar, 2020

- The sample size was determined based on a median DFS of 28 months for standard chemotherapy according to IMPACT (WJOG6410L) trial (UMIN000006252), and median DFS of 43 months for icotinib.
- To achieve 85% power at a two-sided $\alpha = 0.05$ and an anticipated dropout rate of 10%, 320 patients (with 196 events required for the analyses) were needed.
- An interim analysis was planned to perform when 98 (50%) DFS events occurred.
- The overall type I error was controlled at a two-sided α level of 0.003 and 0.049 for the interim and final analyses leveraging the Lan-DeMets alpha-spending function with an O'Brien-Fleming boundary.

EVIDENCE: DFS

- Adjuvant icotinib significantly prolonged DFS vs chemo in stage II-IIIA disease ($P < .0001$)





PHASE III ADAURA STUDY DESIGN

Patients with completely resected stage* IB, II, IIIA NSCLC, with or without adjuvant chemotherapy†

Key inclusion criteria:
- ≥18 years (Japan / Taiwan: ≥20)
- WHO performance status 0 / 1
- Confirmed primary non-squamous NSCLC
- Ex19del / L858R‡
- Brain imaging, if not completed pre-operatively
- Complete resection with negative margins§
- Max. interval between surgery and randomisation:
  - 10 weeks without adjuvant chemotherapy
  - 26 weeks with adjuvant chemotherapy

→ **Stratification by:** **stage** (IB vs II vs IIIA) **EGFRm** (Ex19del vs L858R) **race** (Asian vs non-Asian)

→ **Randomisation 1:1 (N=682)**
- Osimertinib 80 mg, once daily
- Placebo, once daily

Planned treatment duration: 3 years

Treatment continues until:
- Disease recurrence
- Treatment completed
- Discontinuation criterion met

Follow up:
- Until recurrence: Week 12 and 24, then every 24 weeks to 5 years, then yearly
- After recurrence: every 24 weeks for 5 years, then yearly

Endpoints
- **Primary endpoint:** DFS by investigator assessment in stage II / IIIA patients, designed for superiority under the assumed DFS HR of 0.70
- **Key secondary endpoints:** DFS in the overall population¶, DFS at 2, 3, 4, and 5 years, OS, safety, health-related quality of life
- **Pre-specified exploratory endpoints:** Patterns of recurrence, time to CNS disease recurrence or death (CNS DFS)

Early and locally advanced disease

1: What is the role of adjuvant osimertinib for common *EGFR*-mutated, stage IB-IIIA R0 resected NSCLC?

STATEMENT: To date, the use of osimertinib for 3 years, is recommended as adjuvant therapy in patients with resected, stage IB-IIIA (7th American Joint Committee on Cancer TNM edition) NSCLC harboring *EGFR* mutations.

The impressive improvement of DFS, including better CNS control, should ideally be supported by OS and/or quality of life benefit upon mature follow up [I,A].

Passaro A, et al. *Ann Oncol*. 2022;33:466-487.

Here we will present an updated analysis of the final DFS data at the protocol-specified maturity of 50%, a pre-specified exploratory analysis of recurrence patterns and updated safety data, after 2 years of further follow up, in which all patients have had the opportunity to receive the full 3 years of adjuvant treatment

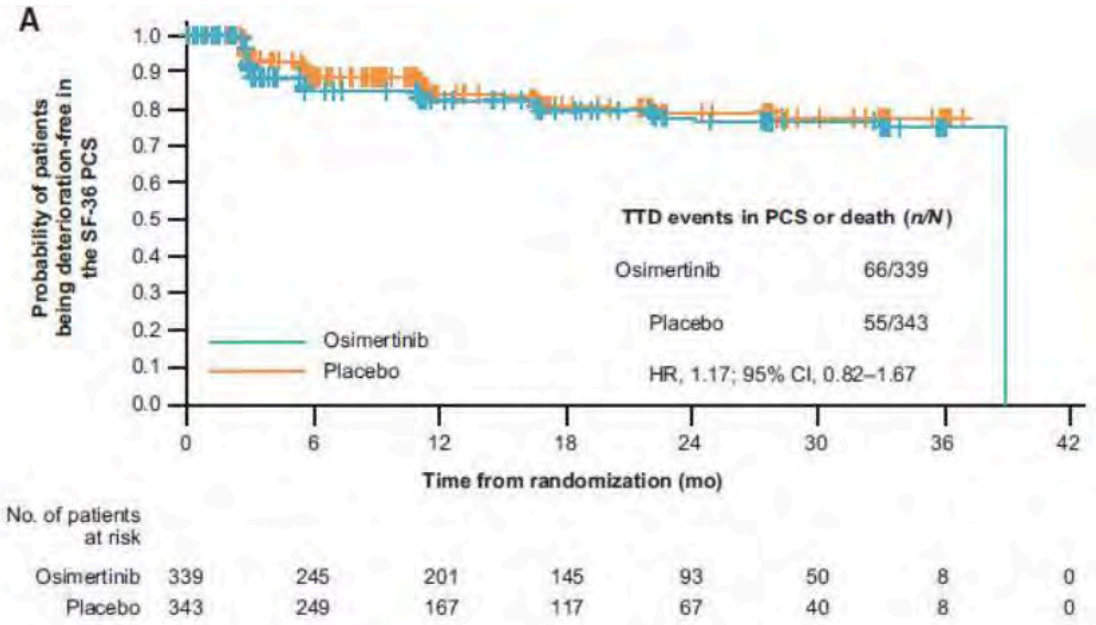
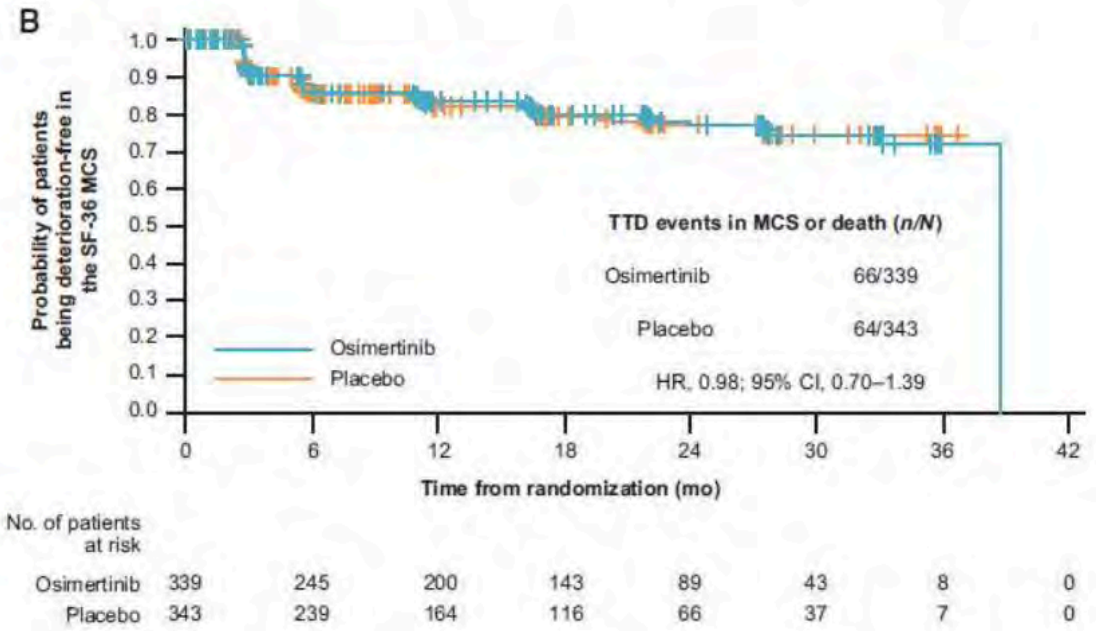
Clin Cancer Res, 2022

"HRQoL was maintained with adjuvant Osimertinib in patients with stage IB–IIIA EGFRm NSCLC, who were disease-free after complete resection, with no clinically meaningful differences versus placebo, further supporting adjuvant osimertinib as a new treatment in this setting"

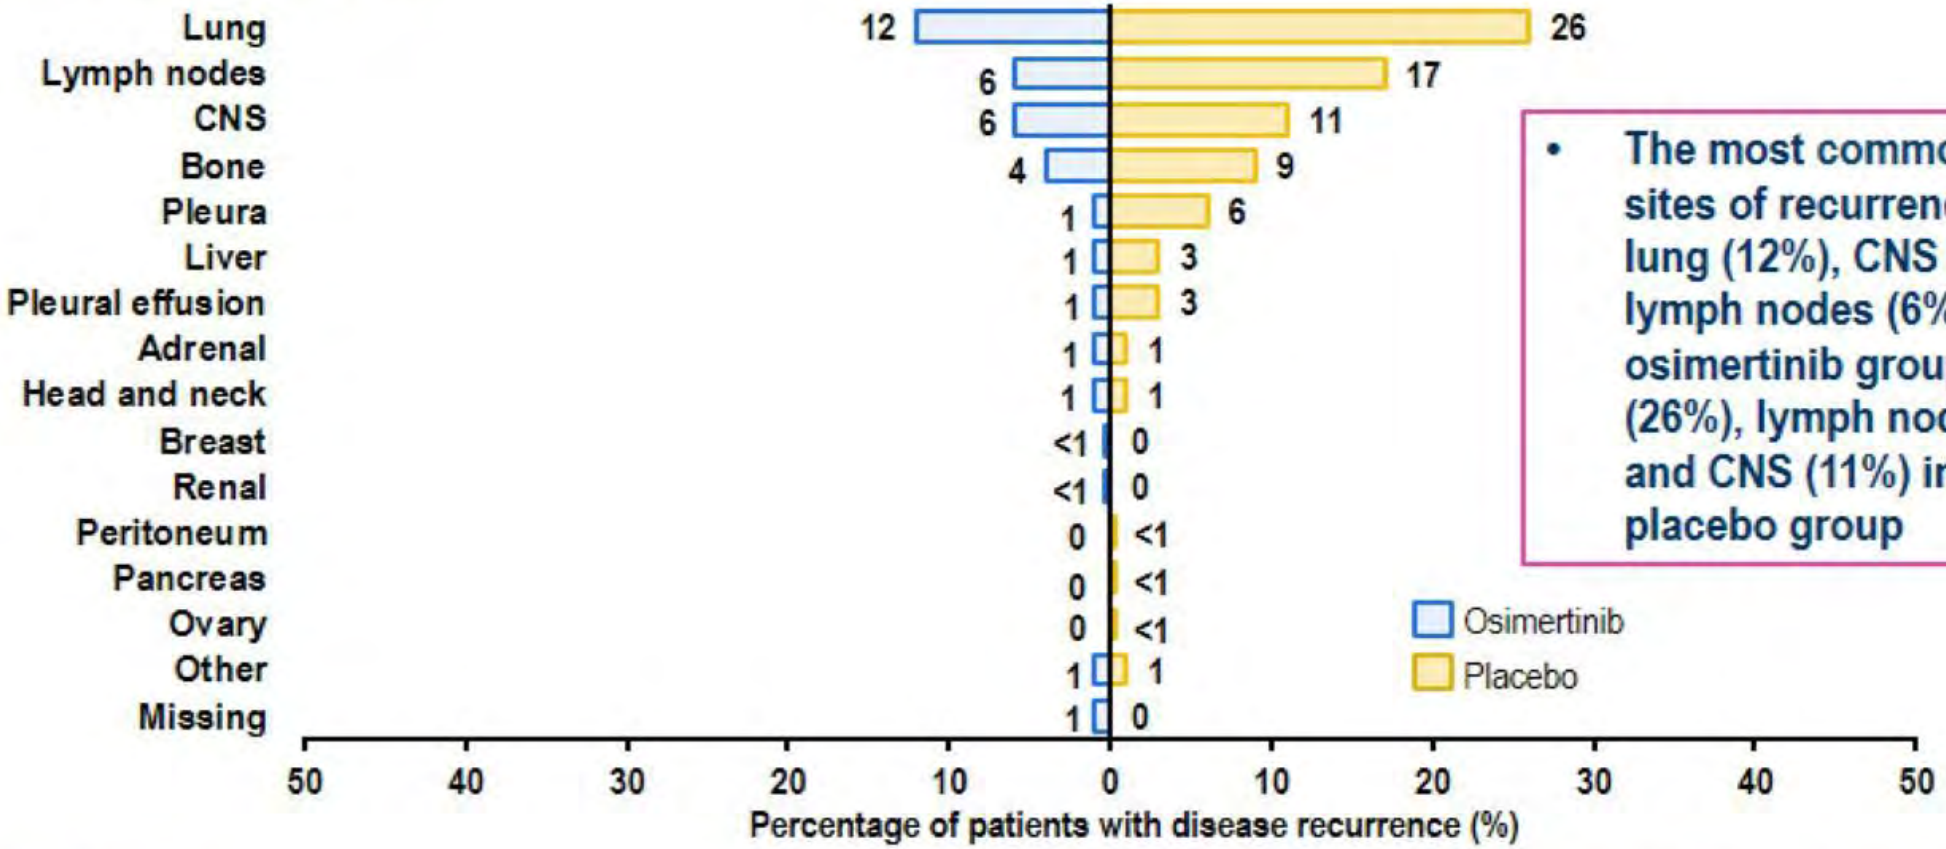




Majem M, et al. *Clin Cancer Res*. 2022;28:2286-2296.

PATTERNS OF DISEASE RECURRENCE (OVERALL POPULATION)

- In the overall population, fewer patients treated with osimertinib had disease recurrence (93/339; 27%) compared with placebo (205/343; 60%)*



- **The most common first sites of recurrence were lung (12%), CNS (6%) and lymph nodes (6%) in the osimertinib group, and lung (26%), lymph nodes (17%) and CNS (11%) in the placebo group**

PARIS 2022 ESMO congress

Masahiro Tsuboi, MD

*Distant recurrence only: osimertinib 45/339 (13%), placebo 107/343 (31%); local/regional only: osimertinib 42/339 (12%), placebo 78/343 (23%); local/regional and distant: osimertinib 6/339 (2%), placebo 20/343 (6%).

NeoADAURA Study

NeoADAURA (NCT04351555): Phase III, Randomized, Controlled, Multicenter Study of Neoadjuvant Osimertinib in EGFRm Resectable NSCLC

Resectable
Stage II–IIIB NSCLC
EGFRm NSCLC (Ex19del / L858R)

N=351

R 1:1:1

- **Placebo + Chemotherapy (3 cycles, Q3W)**
- **Osimertinib + Chemotherapy (3 cycles, Q3W)**
- **Osimertinib (9 weeks)**

→ SURGERY → **MPR & pCR** → **Adjuvant: Investigator choice (optimal care)** → **EFS & OS**

Primary endpoints
Major pathological response* defined as ≤10% residual cancer cells in the lung tumor specimen post-surgery,[1] assessed centrally

Stratification:
- Stage II/III
- Non-Asian/Chinese/ other Asian
- Ex19del/L858R

Double-blind treatment arms:
1. Placebo QD + investigator's choice of pemetrexed 500 mg/m² plus carboplatin AUC5 mg/ml.min or cisplatin 75 mg/m²
2. Osimertinib 80 mg QD + investigator's choice of pemetrexed 500 mg/m² plus carboplatin AUC5 mg/ml.min or cisplatin 75 mg/m²

Open-label (sponsor-blind) treatment arm:
3. Osimertinib 80 mg QD

Adjuvant therapy and follow-up:
- Patients will be followed up for OS until 5 years from surgery, with evaluation at 12 and 24 weeks post-surgery, then every 24 weeks, until disease recurrence or withdrawal of consent
- Osimertinib will be offered to all patients who complete surgery (+/- post-surgical chemotherapy) for up to 3 years or until disease recurrence

ADAURA Phase III double-blind study design

GUSTAVE ROUSSY CANCER CAMPUS GRAND PARIS

Patients with completely resected stage* IB, II, IIIA NSCLC, with or without adjuvant chemotherapy†

Key inclusion criteria:
- ≥18 years (Japan / Taiwan: ≥20)
- WHO performance status 0 / 1
- Confirmed primary non-squamous NSCLC Ex19del / L858R‡
- Brain imaging, if not completed pre-operatively
- Complete resection with negative margins§
- Max. interval between surgery and randomization:
  - 10 weeks without adjuvant chemotherapy
  - 26 weeks with adjuvant chemotherapy

Stratification by:
stage (IB vs II vs IIIA)
EGFRm (Ex19del vs L858R)
race (Asian vs non-Asian)

Randomization 1:1 (N=682)

- Osimertinib 80 mg, once daily
- Placebo, once daily

Planned treatment duration: 3 years

Treatment continues until:
- Disease recurrence
- Treatment completed
- Discontinuation criterion met

Follow up:
- Until recurrence: Week 12 and 24, then every 24 weeks to 5 years, then yearly
- After recurrence: every 24 weeks for 5 years, then yearly

Endpoints

- **Primary**: DFS, by investigator assessment, in stage II/IIIA patients; designed for superiority under the assumed DFS HR of 0.70
- **Secondary**: DFS in the overall population¶, DFS at 2, 3, 4, and 5 years, OS, safety, health-related quality of life

- **Following IDMC recommendation, the study was unblinded early due to efficacy; here we report an unplanned interim analysis**
- **At the time of unblinding the study had completed enrollment and all patients were followed up for at least 1 year**

NCT02511106; ADAURA data cut-off: January 17, 2020. *AJCC 7th edition; †Prior, post, or planned radiotherapy was not allowed; ‡Centrally confirmed in tissue; §Patients received a CT scan after resection and within 28 days prior to treatment; ¶Stage IB / II / IIIA.

LUNG ART phase III Trial

(IFCT-0503, UK NCRI, SAKK)

Trial registry: NCT00410683

Study design

Completely resected NSCLC with N2 histo/ cytologically proven nodal involvement

R

1:1 randomization

Pre-op and/or Post-op CT

Control

Conformal PORT (54 Gy/5,5 wks)

Stratification factors : Center, Administration of CT (no CT vs Post-op CT vs pre-op CT alone), Histology (SCC vs other), Extent of mediastinal lymph node involvement (0 vs 1 vs 2+), use of pre-treatment PET-scan (yes/no)

Primary end-point: Disease-free survival

Secondary end-points: Overall survival, patterns of relapse, local failure, second cancers, and treatment-related toxicity

Le Pechoux C, et al. ESMO 2020. Abstract LBA3_PR.

LUNG ART

DFS (primary endpoint)

Main analysis (Adjusted Cox Model)

HR = 0.85
95% CI = [0.67;1.07]

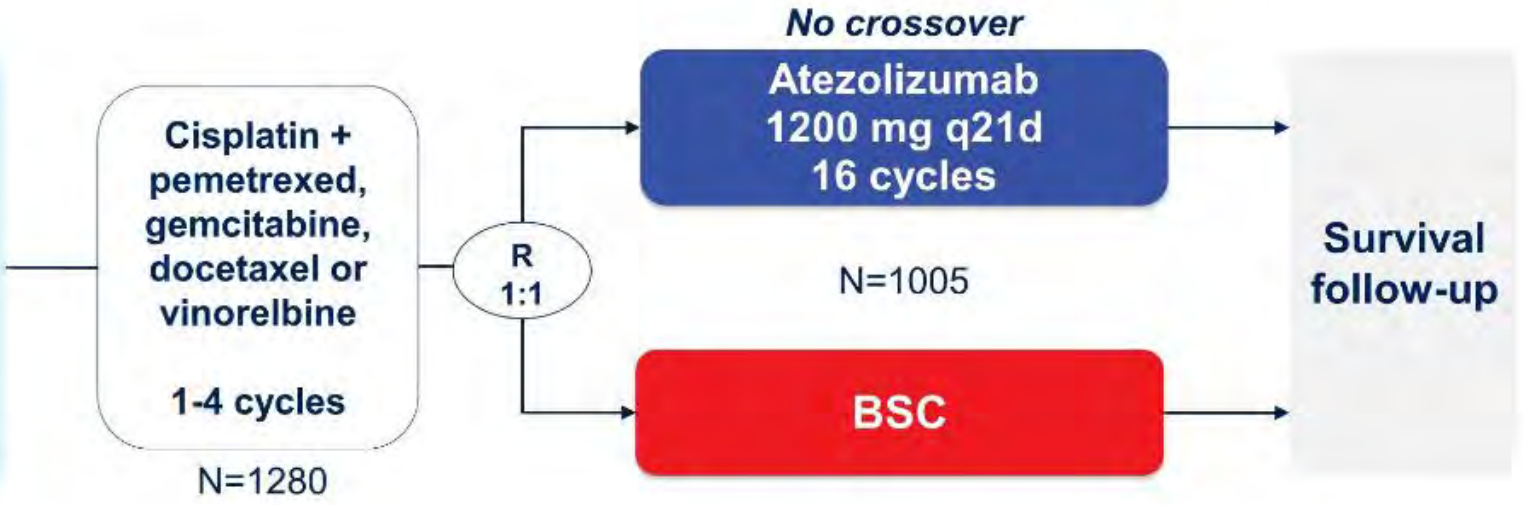
Adjuvant: IMpower010

Completely resected stage IB-IIIA NSCLC per UICC/AJCC v7

- Stage IB tumors ≥4 cm
- ECOG 0-1
- Lobectomy/pneumonectomy
- Tumor tissue for PD-L1 analysis



Stratification factors

- Male/female
- Stage (IB vs II vs IIIA)
- Histology
- PD-L1 tumor expression status[a]: TC2/3 and any IC vs TC0/1 and IC2/3 vs TC0/1 and IC0/1

Primary endpoints

- Investigator-assessed DFS tested hierarchically:
  - PD-L1 TC ≥1% (per SP263) stage II-IIIA population
  - All-randomized stage II-IIIA population
  - ITT population (stage IB-IIIA)

Key secondary endpoints

- OS in ITT population
- DFS in PD-L1 TC ≥50% (per SP263) stage II-IIIA population
- 3-y and 5-y DFS in all 3 populations

Wakelee HA, et al. ASCO 2021. Abstract 8500.

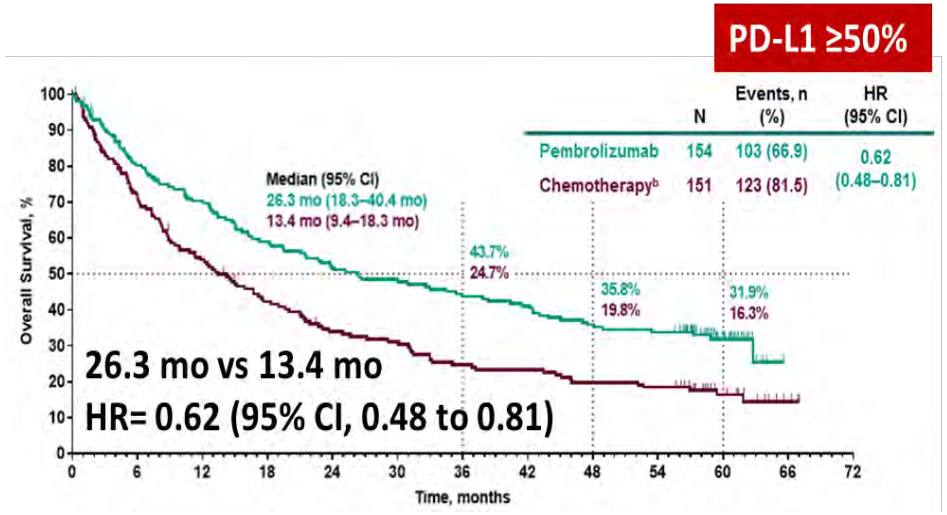
KEYNOTE-024
First-Line Pembrolizumab
Stage IIIB–IV Population



Felip E, et al. ESMO 2021. Abstract LBA9.

PEARLS/KEYNOTE-091 Study Design

Randomized, Triple-Blind, Phase 3 Trial

Eligibility for Registration

- Confirmed stage IB (T ≥4 cm), II, or IIIA NSCLC per AJCC v7
- Complete surgical resection with negative margins (R0)
- Provision of tumor tissue for PD-L1 testing

PD-L1 testing
done centrally using PD-L1 IHC 22C3 pharmDx

Eligibility for Randomization

- No evidence of disease
- ECOG PS 0 or 1
- Adjuvant chemotherapy
  - Considered for stage IB (T ≥4 cm) disease
  - Strongly recommended for stage II and IIIA disease
  - Limited to ≤4 cycles

R 1:1

Pembrolizumab 200 mg Q3W for ≤18 administrations (~1 yr)

Placebo Q3W for ≤18 administrations (~1 yr)

Stratification Factors

- Disease stage (IB vs II vs IIIA)
- PD-L1 TPS (<1% vs 1-49% vs ≥50%)
- Receipt of adjuvant chemotherapy (yes vs no)
- Geographic region (Asia vs Eastern Europe vs Western Europe vs rest of world)

Dual Primary End Points

- DFS in the overall population
- DFS in the PD-L1 TPS ≥50% population

Secondary End Points

- DFS in the PD-L1 TPS ≥1% population
- OS in the overall, PD-L1 TPS ≥50%, and PD-L1 TPS ≥1% populations
- Lung cancer-specific survival in the overall population
- Safety

Case study: 64 year old female
> polling question

- **Which of the following options do you prefer?**
  1. **Surgical resection/LN dissection followed by adjuvant chemotherapy**
  2. **Neoadjuvant chemotherapy followed by surgical resection/LN dissection**
  3. **Neoadjuvant chemoradiotherapy followed by surgical resection/LN dissection**
  4. **Trial with neoadjuvant chemo-immunotherapy followed by surgical resection/LN dissection**

Case study: 64 year old female

> multidisciplinary tumor board

- Thoracic surgeon: major hilar N1 disease will most probably lead to pneumonectomy – neoadjuvant approach preferred
- 3 cycles of neoadjuvant therapy -> little volume change, but metabolic response on FDG PET-CT
- Surgery
  - Resection limited to superior bilobectomy
- Pathology: ypT1aN0
  - Few viable tumor cells
  - All lymph nodes free of tumor

Preoperative Nivolumab Does Not Increase Surgery-Related AEs

Erasmus MC Cancer Institute

Table 2. Adverse Events.*

Event	Nivolumab plus Chemotherapy (N=176)		Chemotherapy Alone (N=176)	
	Any Grade	Grade 3 or 4	Any Grade	Grade 3 or 4
Adverse events of any cause — no. (%)†				
All	163 (92.6)	72 (40.9)	171 (97.2)	77 (43.8)
Leading to discontinuation of treatment	18 (10.2)	10 (5.7)	20 (11.4)	7 (4.0)
Serious	30 (17.0)	19 (10.8)	24 (13.6)	17 (9.7)
Treatment-related adverse events — no. (%)†				
All	145 (82.4)	59 (33.5)	156 (88.6)	65 (36.9)
Leading to discontinuation of treatment	18 (10.2)	10 (5.7)	17 (9.7)	6 (3.4)
Serious	21 (11.9)	15 (8.5)	18 (10.2)	14 (8.0)
Death‡	0	—	3 (1.7)	—
Surgery-related adverse events — no./total no. (%)§	62/149 (41.6)	17/149 (11.4)	63/135 (46.7)	20/135 (14.8)

* Adverse events were coded according to the *Medical Dictionary for Regulatory Activities*, version 24.0, and were graded according to the Common Terminology Criteria for Adverse Events, version 4.0.
† Included are events reported between the first neoadjuvant dose and 30 days after the last neoadjuvant dose.
‡ Treatment-related deaths in the chemotherapy-alone group were due to pancytopenia, diarrhea, acute kidney injury (all in one patient), enterocolitis, and pneumonia.
§ The denominators are based on patients who underwent definitive surgery. Included are events reported up to 90 days after definitive surgery. Grade 5 surgery-related adverse events (defined as events that led to death ≤24 hours after the onset of an adverse event) were reported in two patients in the nivolumab-plus-chemotherapy group and were deemed by the investigator to be unrelated to the trial drugs (one each due to pulmonary embolism and aortic rupture).

Forde PM, et al. *N Engl J Med*. 2022;386:1973-1985.

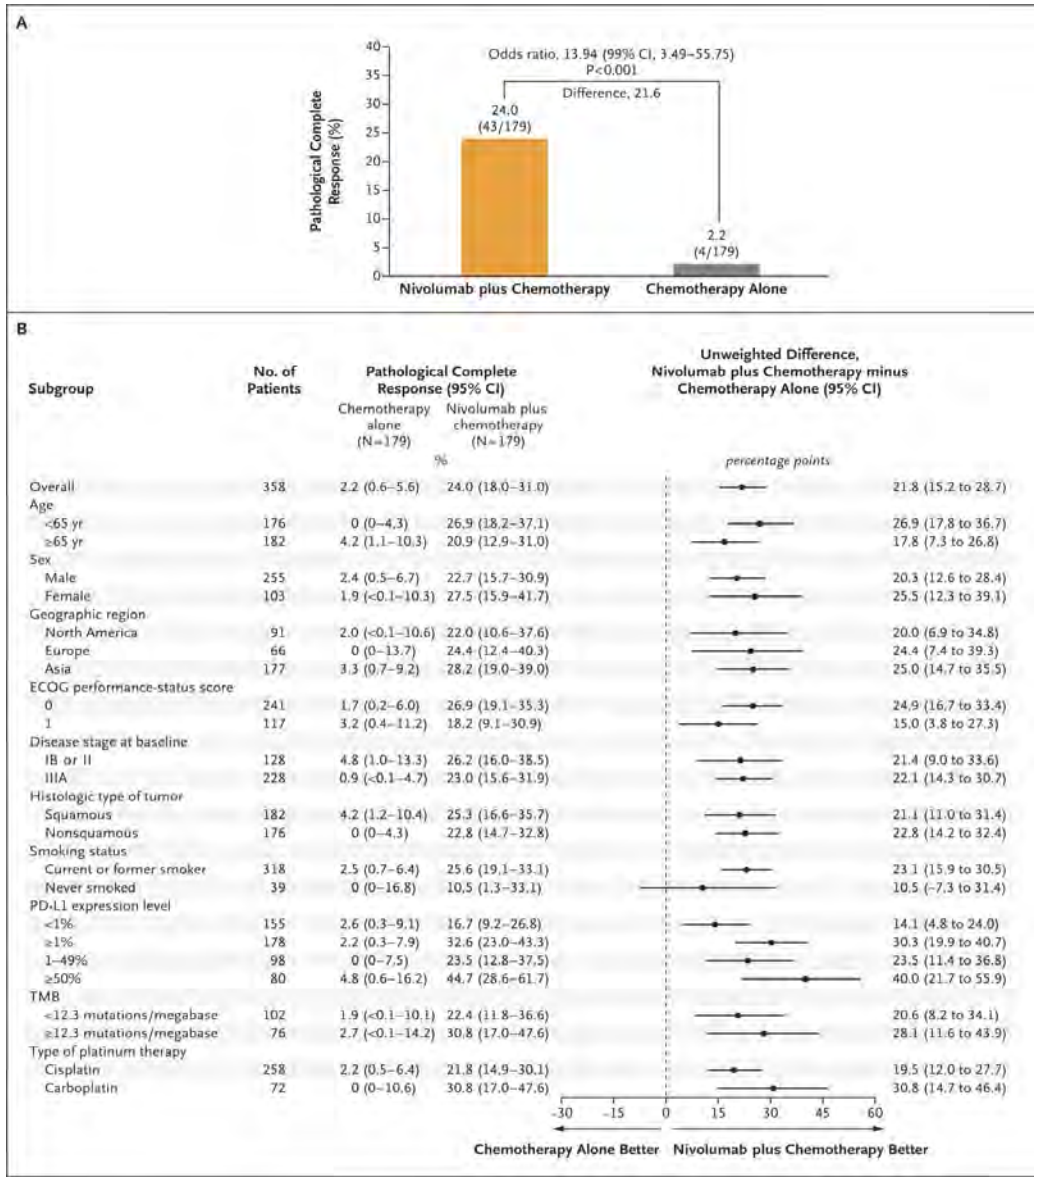
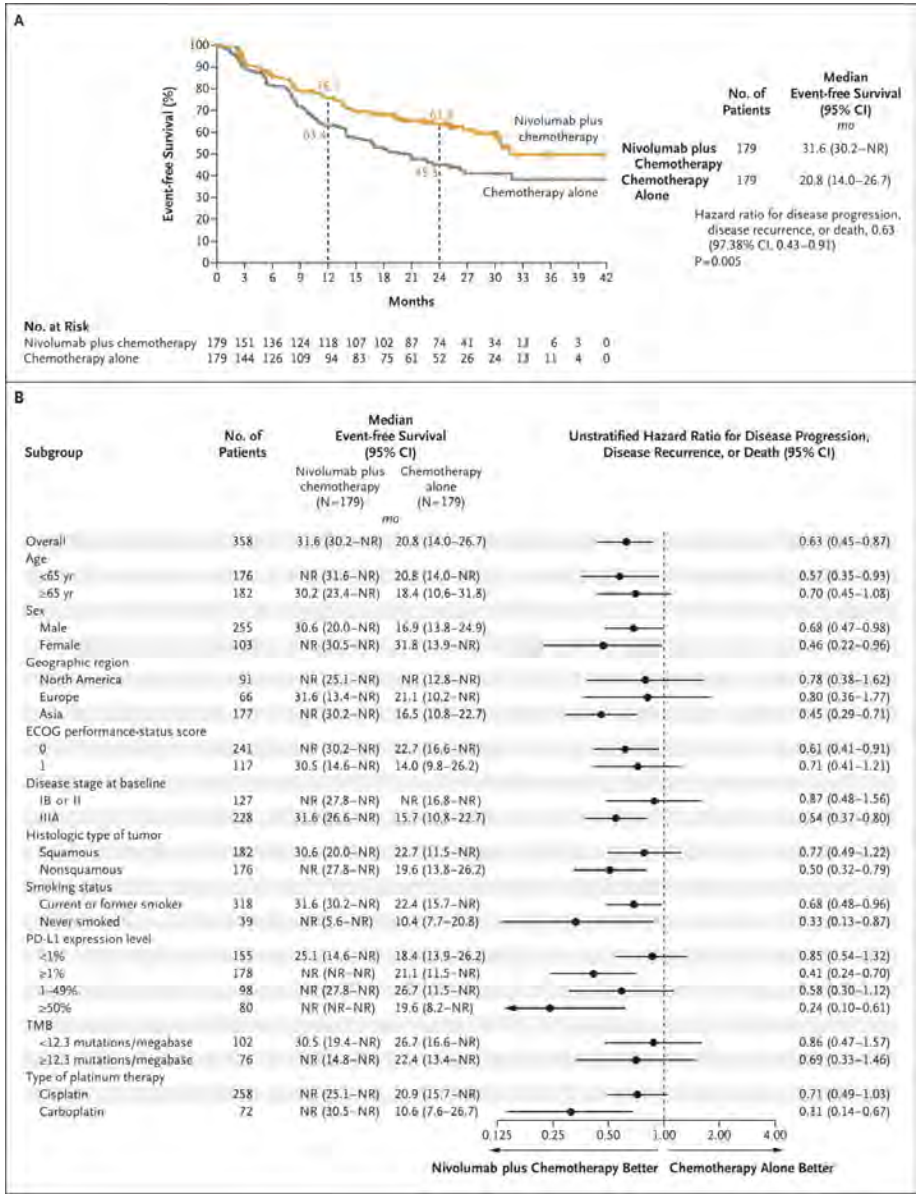
pCR Rate Driven by PD-L1 Expression



Forde PM, et al. *N Engl J Med*. 2022;386:1973-1985.

Neoadjuvant Chemo-Nivolumab Increases EFS

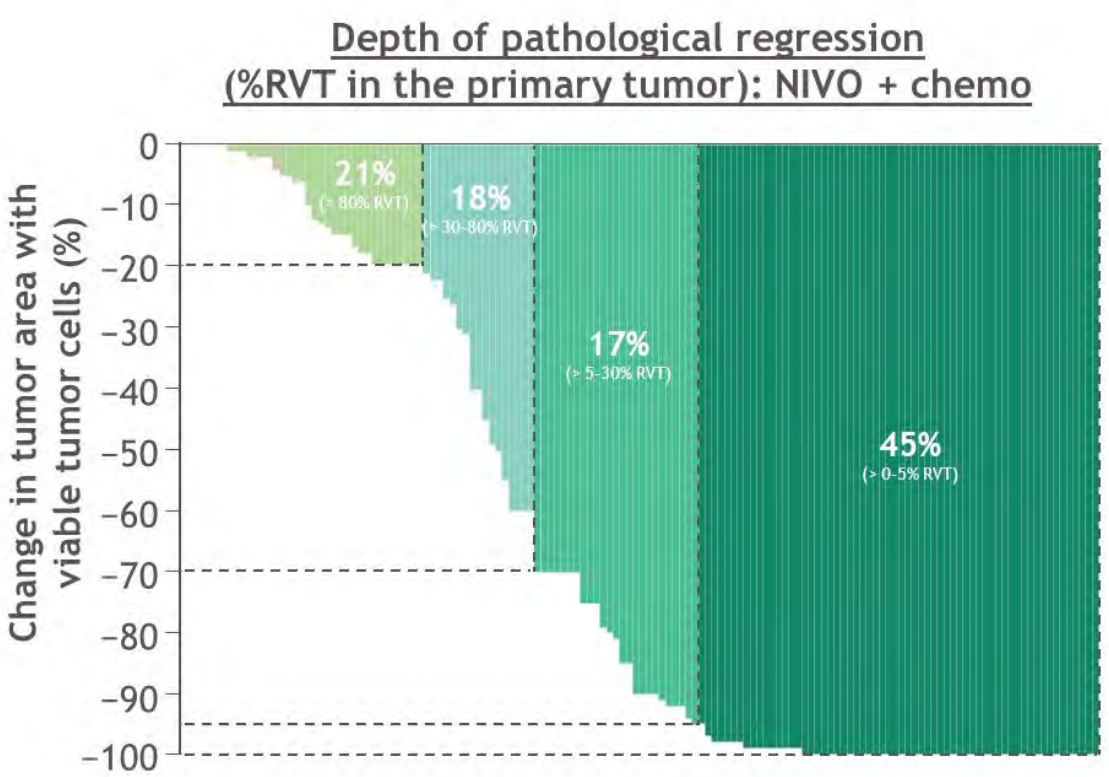


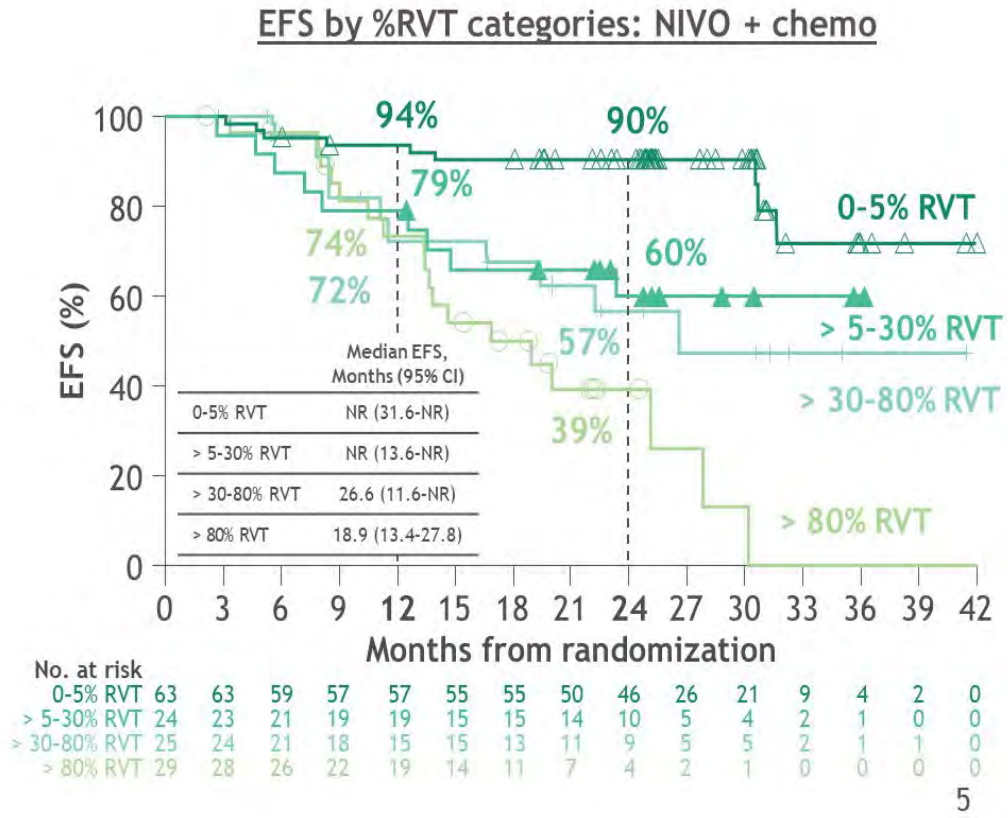
EFS is longer in patients with pCR

In non-pCR, mEFS is 26.6 mo vs 18.4 mo; HR 0.84(95% CI: 0.61–1.17)

Forde PM, et al. *N Engl J Med*. 2022;386:1973-1985.

Neoadjuvant CheckMate 816: EFS vs Pathologic Response

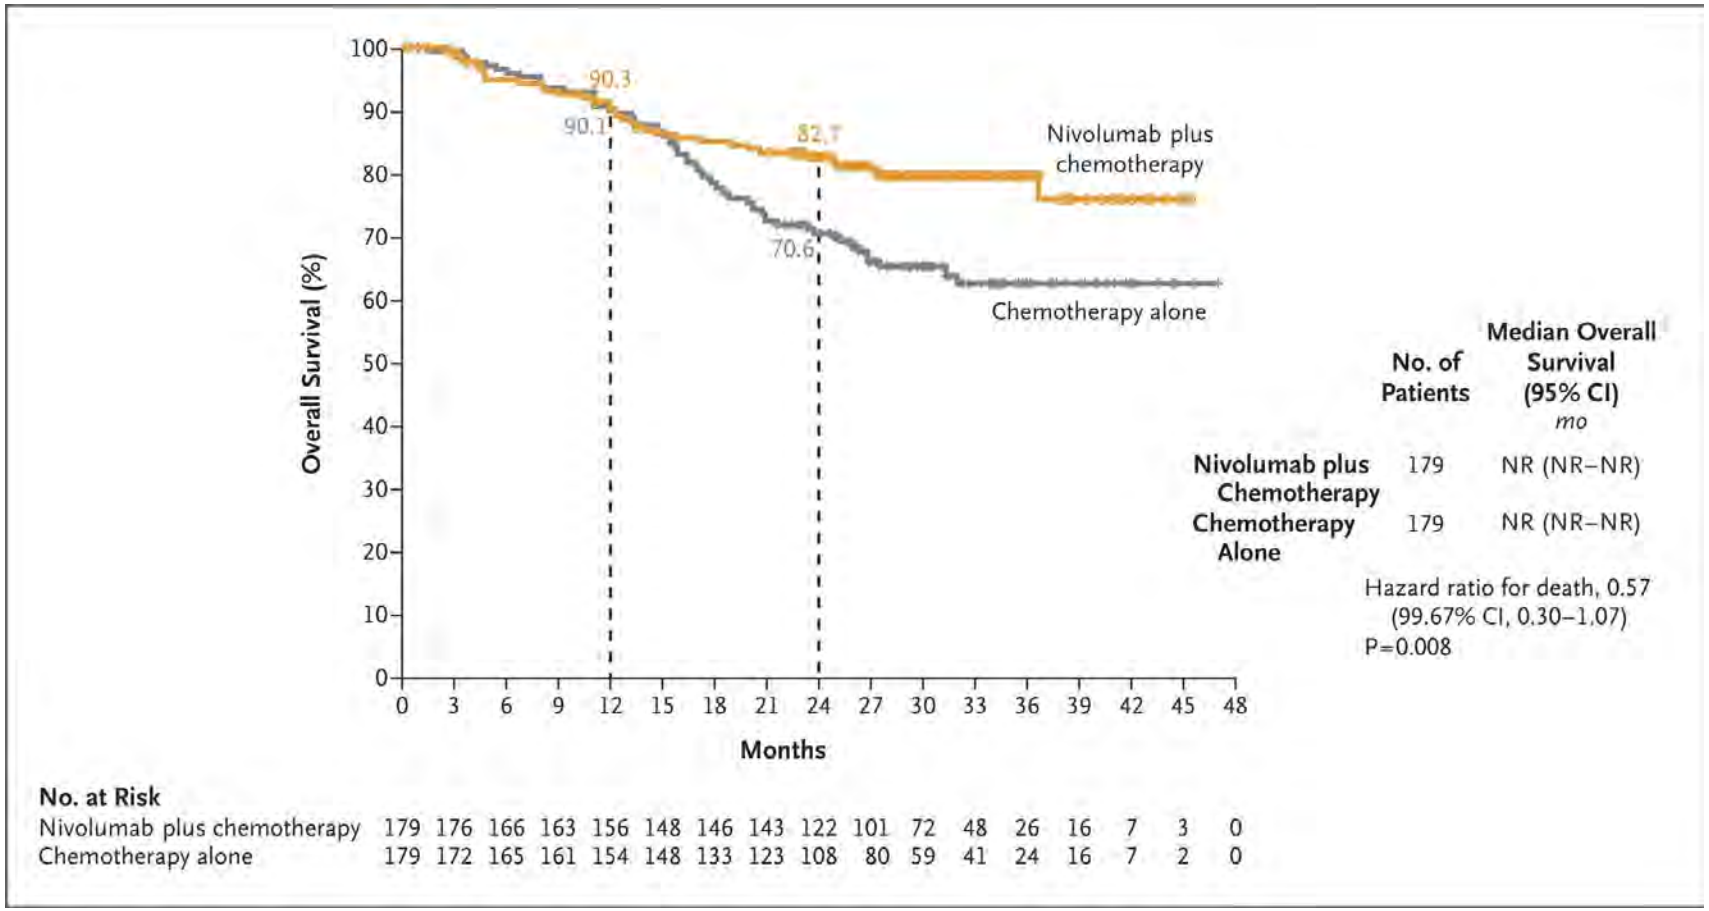




In pCR, EFS benefit independent of PD-L1 or stage

Provencio-Pulla M, et al. *J Clin Oncol*. 2022;40(17 suppl): abstract LBA8511.

Overall Survival: Preoperative Chemo-Nivolumab



OS is key secondary endpoint.

At first planned interim analysis, did not meet criteria for significance

Forde PM, et al. *N Engl J Med*. 2022;386:1973-1985.

Digital vs Manual MPR in LCMC3

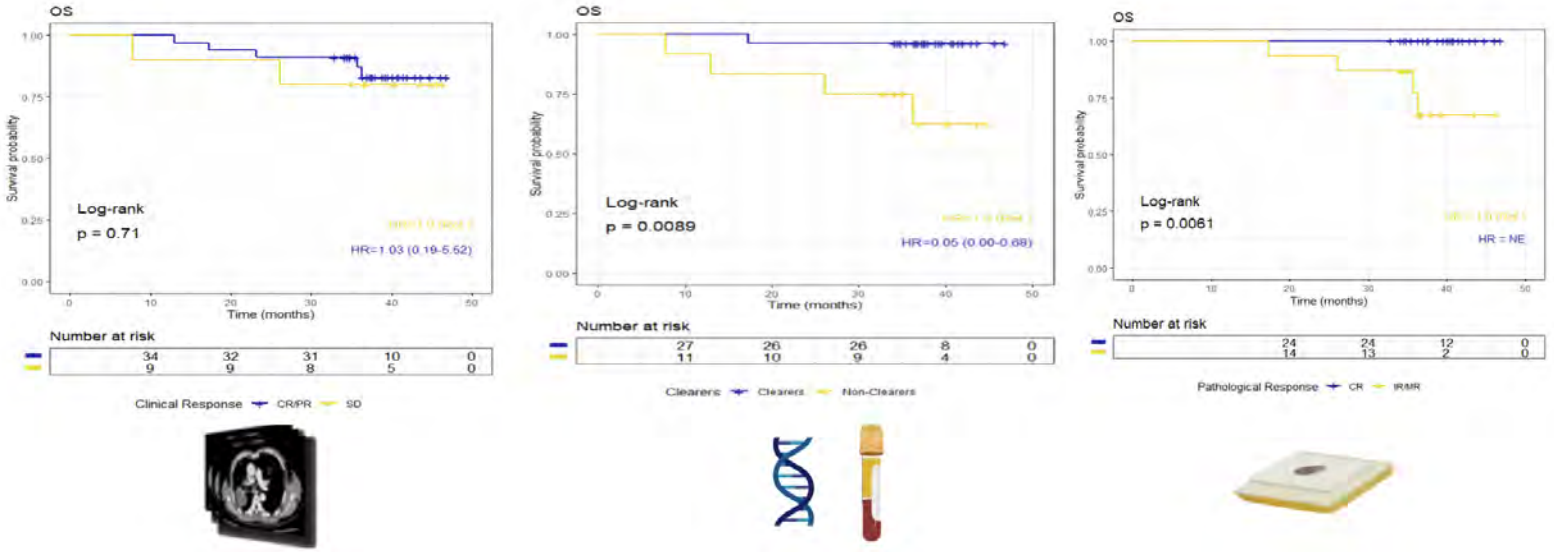
ctDNA Clearance	0.3	0.08-1.11	**0.072**	0.62	0.43-0.81	0.05	0.00-0.68	**0.024**	0.79	0.55-1.03

MOLECULAR RESPONSE

Clearers

Non-clearers

ctDNA clearance (i.e lack of detectable ctDNA at the end of neoadjuvant tx), **significantly predicted long-term survival.**

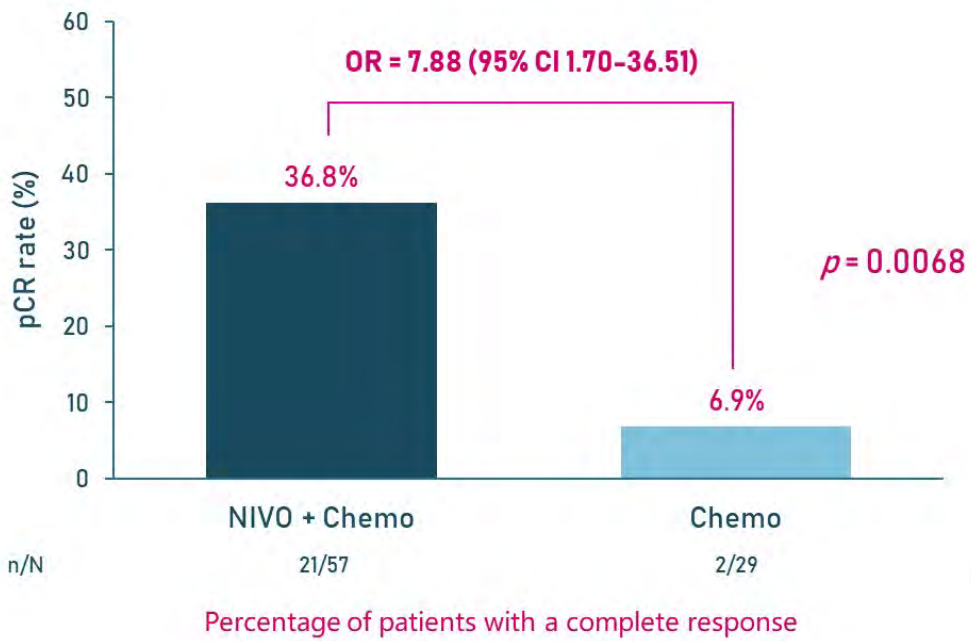


Provencio M, et al. WCLC 2021. Abstract OA20.01.

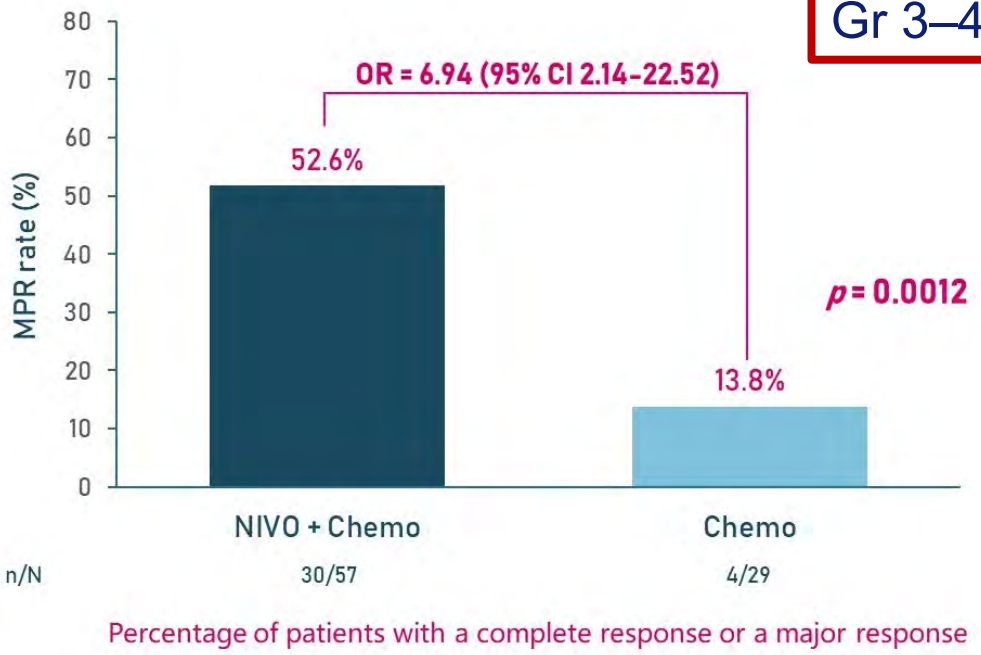
NADIM: High pCR Rate in Line With CM816

Erasmus MC Cancer Institute

pCR rate



MPR rate

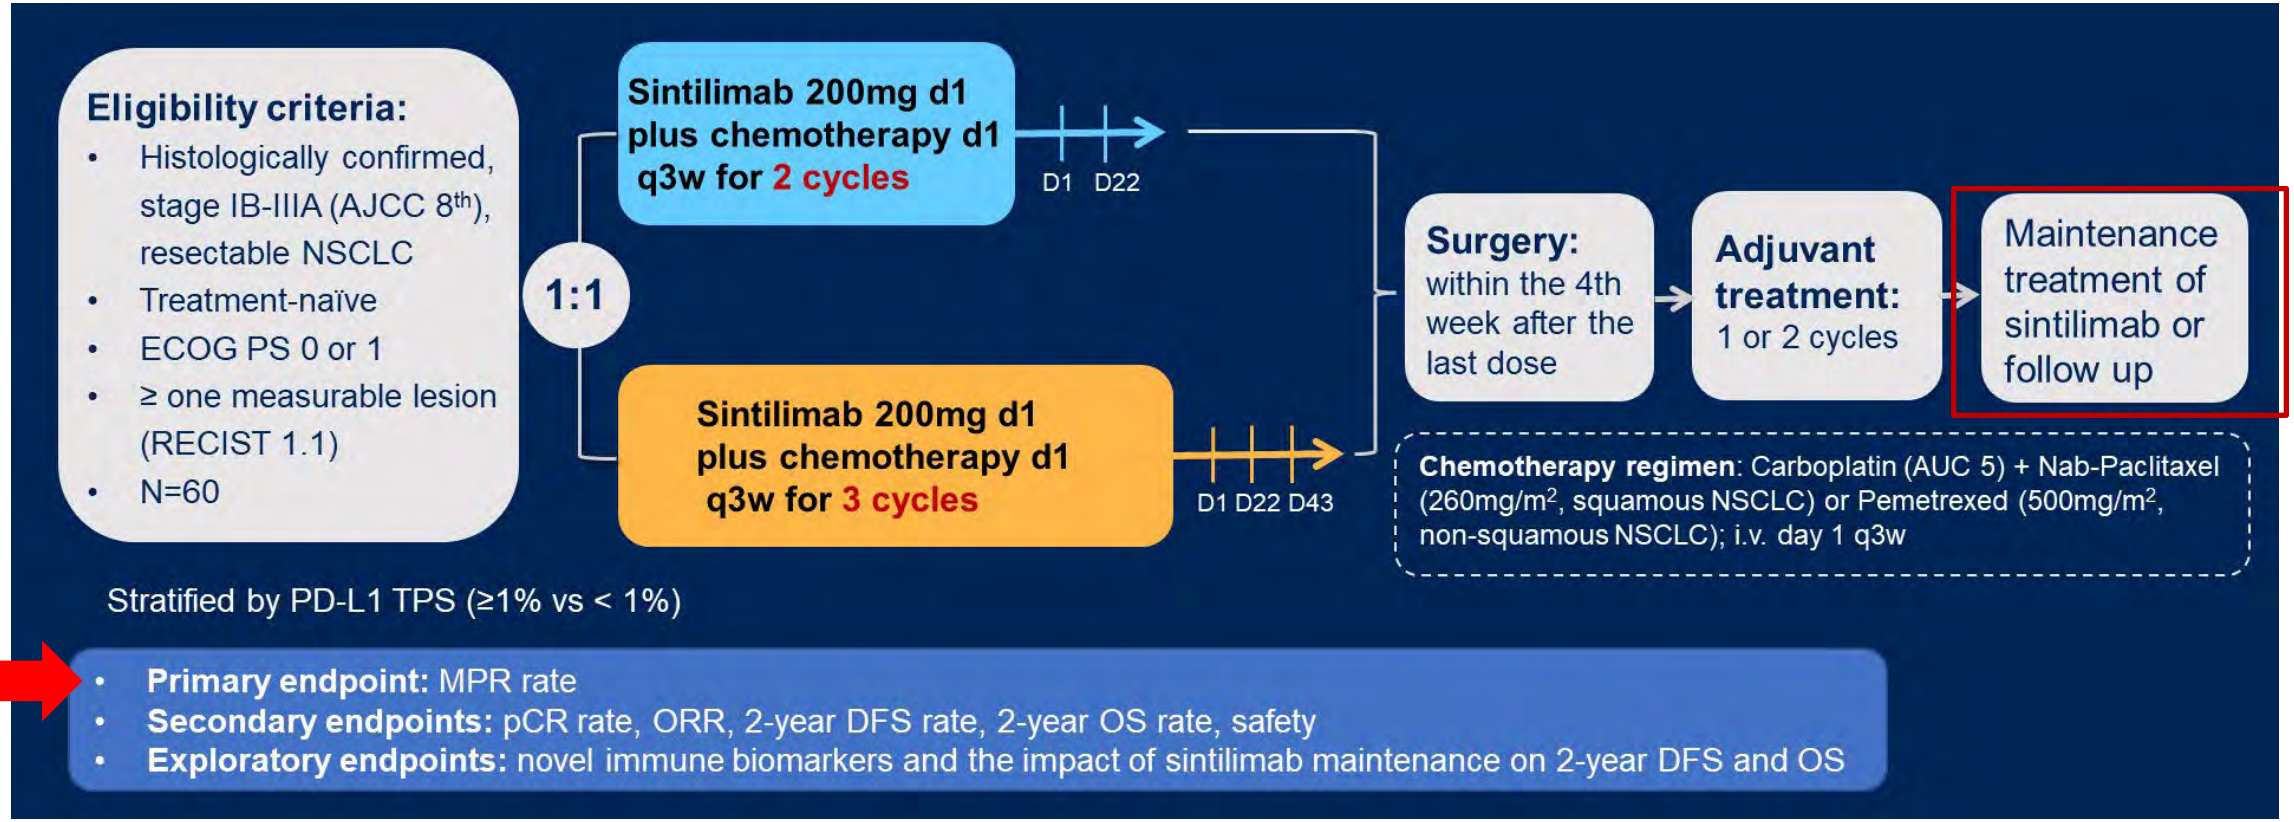


ORR: 75% vs 48%
Gr 3–4 tox: 25% vs 10%

pCR driven by PD-L1

Provencio M, et al. *J Clin Oncol.* 2022;40:2924-2933.

neoSCORE Phase II: 2 or 3 Cycles of Neoadjuvant Treatment



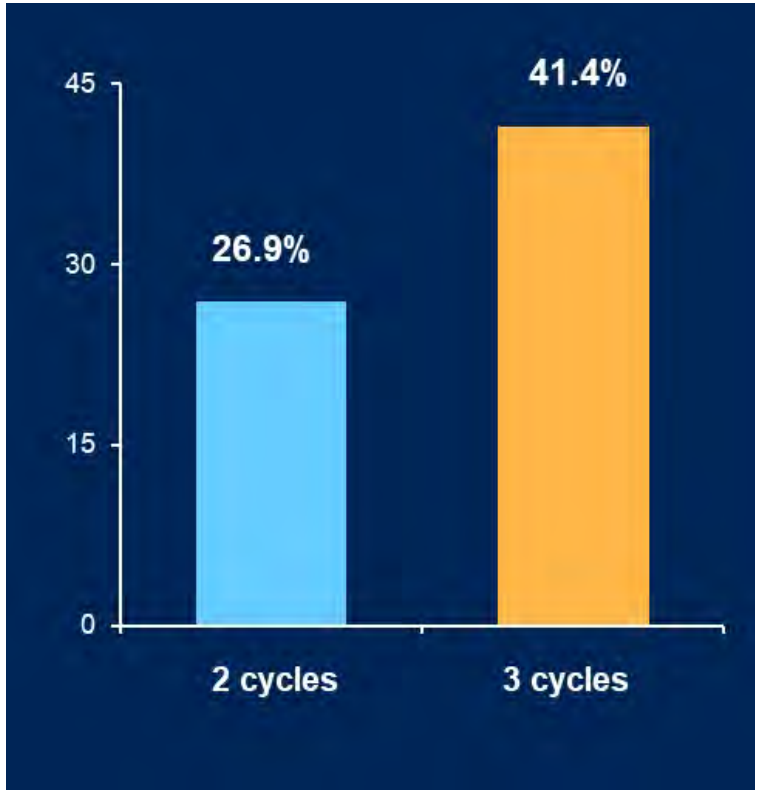
DSMB: unplanned stop of enrollment after N = 60/102
99% on to resection, 1/3 stage IIIA, 1/3 never smoker, 1/2 PD-L1 neg
Tox 3 cycles ~ 2 cycles

Qiu F, et al. *J Clin Oncol.* 2022;40(16 suppl): abstract 8500.

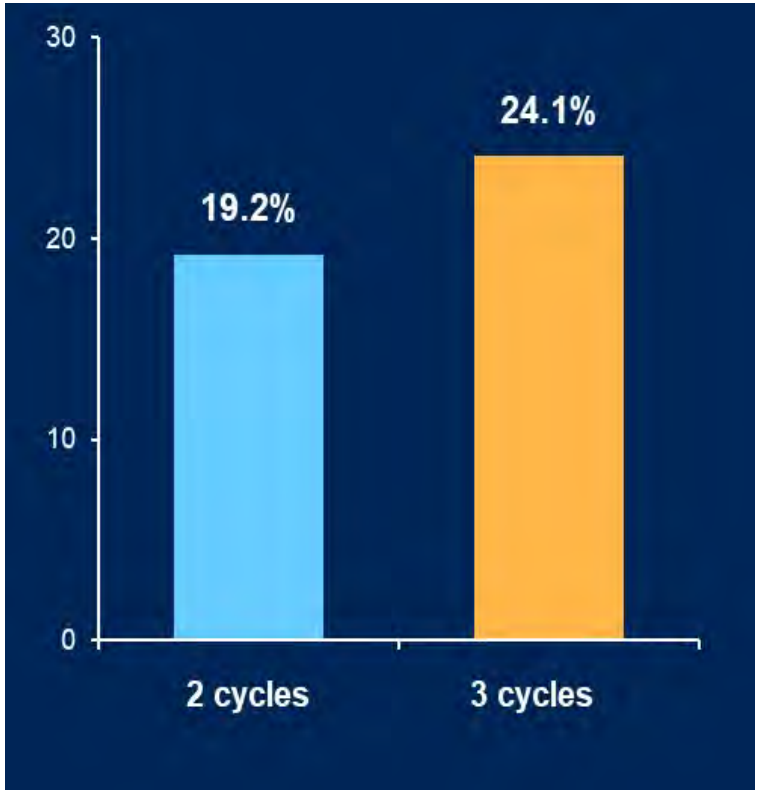
Numerically Higher MPR and pCPR With 3 Cycles, but Also Longer Time Between Cycle 1–2 and Surgery!

Erasmus MC Cancer Institute

MPR rate



pCR rate



MPR/pCR more frequent in SQ and high PD-L1 (≥45%)

Qiu F, et al. *J Clin Oncol.* 2022;40(16 suppl): abstract 8500.

	Total, n=55	2 cycles, n=26	3 cycles, n=29	*P* value*
ORR, n (%)	29（52.7%）(95% CI：38.8-66.3%)	13（50.0%）(95% CI：29.9-70.1%)	16（55.2%）(95% CI：35.7-73.6%)	0.701

All resected patients were included (n=55) to calculate the percentage change in maximum tumor diameter from baseline via RECIST v1.1. The dashed lines represented PD (20% increase in tumor size) and PR (30% reduction in tumor size);
*, the two-sided *P* value was from the $\chi 2$ test, the exact two-sided 95% CIs were calculated by use of the Clopper-Pearson method.

Radiologic response underestimates pathologic response

Qiu F, et al. *J Clin Oncol.* 2022;40(16 suppl): abstract 8500.

	CheckMate 816		NADIM		neoSCORE	
	NIVO + chemo × 3	Chemo × 3	NIVO + chemo × 3	Chemo × 3	Sintilimab + chemo × 2	Sintilimab + chemo × 3
N	179	179	57	29		
Stage III	63%	64%	100%	100%	62%	45%
Surgery	83%	75%	92%	69%	89%	97%
CPR	24%	2%	37%	7%	19%	24%

Conclusions: Neoadjuvant Therapy for Resectable NSCLC

Erasmus MC Cancer Institute

Neoadjuvant chemo-IO

- Feasible
- Impressive pCR ~ DFS ---→ >OS?
- Resectable stage IIIa (~CRT?)

Q1: Adjuvant Treatment?

	Clinical trial[a]	Neoadjuvant treatment		Surgery	Adjuvant treatment		Primary end points	Disease stage
Adjuvant	IMpower 010				Platinum-doublet (mandatory)	Atezolizumab × 16 cycles / Observation	DFS (hierarchical testing)[d]	IB(≥ 4 cm)-IIIA (seventh TNM)
Adjuvant	PEARLS				Platinum-doublet (optional)	Pembrolizumab × 18 cycles / Placebo	DFS all-comers[d] DFS in PD-L1 ≥ 50%	IB(≥ 4 cm)-IIIA (seventh TNM)
Adjuvant	BR.31				Platinum-doublet (optional)	Durvalumab × 12 months / Placebo	DFS in PD-L1 ≥ 25%[d]	IB(≥ 4 cm)-IIIA (seventh TNM)
Adjuvant	ANVIL[b, c]				Platinum-doublet (optional)	Nivolumab × 16 cycles / Observation	DFS, OS[d]	IB(≥ 4 cm)-IIIA (seventh TNM)
Adjuvant	ACCIO[b, c]				Platinum-doublet × four cycles / Platinum-doublet × four cycles / Platinum-doublet plus pembrolizumab × four cycles	Observation / Pembrolizumab × 16 cycles / Pembrolizumab × 12 cycles	DFS, OS[d]	IIB-IIIB(T3N2) (eighth TNM)
Neoadjuvant	CheckMate 816[b]	Platinum-doublet plus nivolumab × three cycles / Platinum-doublet plus placebo × three cycles					pCR, EFS[d]	IB-IIIA (seventh TNM)
Neoadjuvant	KEYNOTE 671	Platinum-doublet plus pembrolizumab × four cycles / Platinum-doublet plus placebo × four cycles			Pembrolizumab × 13 cycles / Placebo × 13 cycles		EFS, OS[d]	II-IIIA (eighth TNM)
Neoadjuvant	IMPOWER 030[b]	Platinum-doublet plus atezolizumab × four cycles / Platinum-doublet plus placebo × four cycles			Atezolizumab × 16 cycles / Observation		EFS	II-IIIB (eighth TNM)
Neoadjuvant	CheckMate 77T[b]	Platinum-doublet plus nivolumab × four cycles / Platinum-doublet plus placebo × four cycles			Nivolumab × 1 year / Placebo × 1 year		EFS	II-IIIB(T3N2) (eighth TNM)
Neoadjuvant	AEGEAN	Platinum-doublet plus durvalumab × four cycles / Platinum-doublet plus placebo × four cycles			Durvalumab × 12 cycles / Placebo × 12 cycles		pCR, EFS[d]	IIA-IIIB(T3N2) (eighth TNM)
Neoadjuvant	NCT05157776[b]	Platinum-doublet plus sintilimab × two cycles / Platinum-doublet plus sintilimab × four cycles			Platinum-doublet plus sintilimab × 2 cycles (optional) / Observation		pCR	IIIA (eighth TNM)
Neoadjuvant	RATIONALE 315[b]	Platinum-doublet plus tislelizumab / Platinum-doublet plus placebo			Tislelizumab / Placebo		ORR R0 resection rate	II-IIIA (eighth TNM)
Neoadjuvant	NCT04158440[b]	Platinum-doublet plus toripalimab × four cycles / Platinum-doublet plus placebo × four cycles			Toripalimab × 13 cycles / Placebo × 13 cycles		MPR, EFS[d]	IIIA (eighth TNM)

Passaro A, et al. *J Clin Oncol*. 2022;40:2871-2877.

Q2: Cisplatin >> Carboplatin

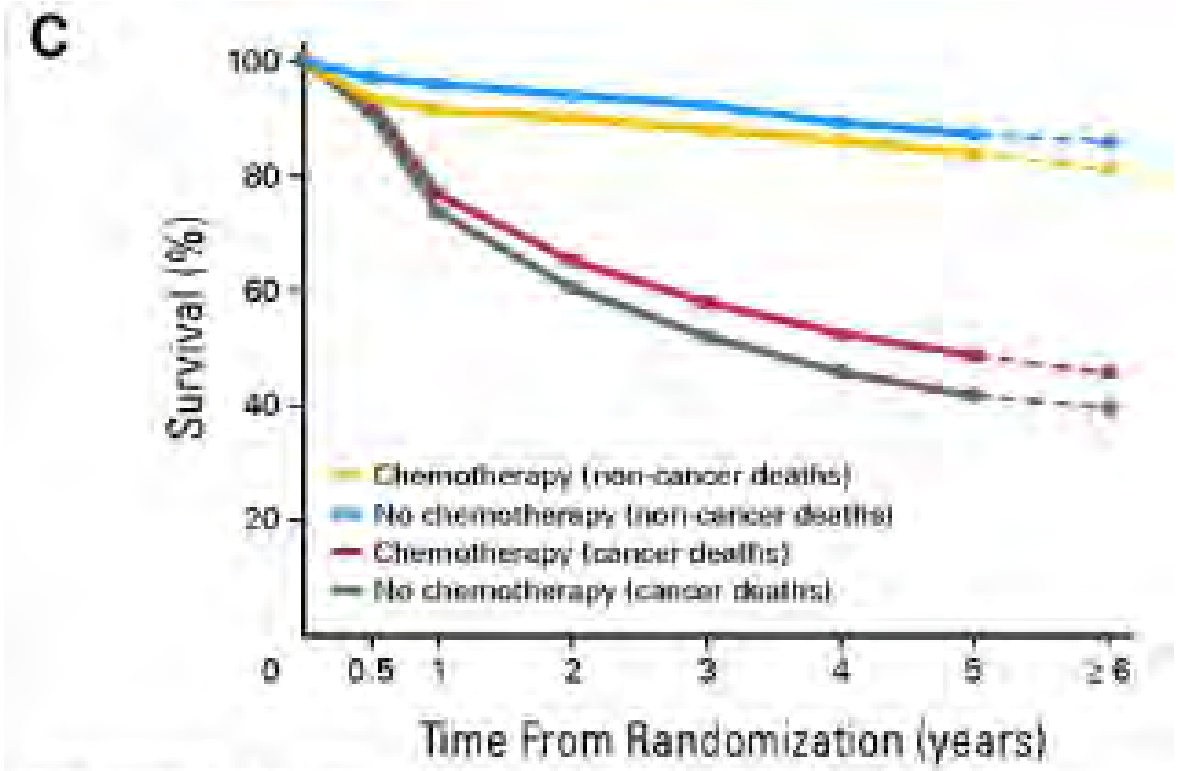
	Number of trials	Number of deaths/ patients	Hazard ratio (95%CI), p value	Hetero-geneity p value	F ratio p value	Interaction p value
Survival by planned chemotherapy schedule (n=15 trials)					0·32	0·23
Preoperative chemotherapy only	10	1045/1883	0·90 (0·80–1·02), 0·09	0·10		
Preoperative and postoperative chemotherapy (to responders)	5	382/502	0·78 (0·64–0·95), 0·02	0·62		
Survival by number of preoperative chemotherapy cycles (n=14 trials)					0·74	0·68
2 cycles	6	418/576	0·89 (0·74–1·08), 0·25	0·39		
3 cycles	8	1002/1799	0·85 (0·75–0·96), 0·01	0·10		
Survival by chemotherapy regimen (n=14 trials)					0·96 (all trials), 0·94 (platinum-only trials)	0·95 (all trials), 0·91 (platinum-only trials)
Platinum plus second generation chemotherapy	7	543/694	0·86 (0·72–1·02), 0·08	0·03		
Platinum plus third generation chemotherapy	6	801/1540	0·85 (0·74–0·97), 0·02	0·57		
Non-platinum chemotherapy	1	38/62	0·95 (0·50–1·79), 0·87	NA		
Survival by the number of chemotherapy agents (n=15 trials)					0·90 (all trials), 0·70 (platinum-only trials)	0·84 (all trials), 0·61 (platinum-only trials)
Non-platinum single agent regimen	1	38/62	0·95 (0·50–1·79), 0·87	NA		
Doublet regimen	9	907/1702	0·88 (0·78–1·01), 0·06	0·42		
Triplet regimen	5	475/611	Fixed effect 0·83 (0·69–1·00), 0·05; random effects 0·79 (0·53–1·18), 0·25	0·01		
Survival by chemotherapy regimen and number of chemotherapy agents (n=14 trials)					0·89 (all trials), 0·95 (platinum-only trials)	0·79 (all trials), 0·62 (platinum-only trials)
Non-platinum single agent regimen	1	38/62	0·95 (0·50–1·79), 0·87	NA		
Platinum second generation, doublet	2	68/83	1·08 (0·68–1·76), 0·76	0·42		
Platinum second generation, triplet	5	475/611	Fixed effect 0·83 (0·69–1·00), 0·05; random effects 0·79 (0·53–1·18), 0·25	0·01		
Platinum third generation, doublet	6	801/1540	0·85 (0·74–0·97), 0·02	0·57		
Survival by cisplatin or carboplatin regimen (n=12 trials)					0·54	0·48
Cisplatin-based	7	830/1289	0·83 (0·72–0·95), 0·01	0·08		
Carboplatin-based	5	492/905	0·90 (0·75–1·07), 0·23	0·88		
Survival by planned postoperative radiotherapy (n=15 trials)					0·64	0·57
No postoperative radiotherapy given	8	431/852	0·83 (0·68–1·01), 0·05	0·40		
Postoperative radiotherapy given	7	996/1533	0·88 (0·78–1·00), 0·05	0·09		
Survival by whether trial stopped early (all trials; n=15 trials)					0·10	0·05
Reached target accrual	3	800/1287	0·90 (0·79–1·04), 0·16	0·66		
Stopped for benefit of chemotherapy	2	92/119	0·48 (0·31–0·74), <0·001	0·43		
Stopped for high progression on chemotherapy arm	1	16/26	1·08 (0·41–2·90), 0·87	NA		
Stopped for poor accrual/positive adjuvant trials	9	519/953	0·88 (0·74–1·05), 0·17	0·31		

NA=not applicable.

Table 3: Effect of preoperative chemotherapy by prespecified trial group

Pignon JP, et al. *J Clin Oncol*. 2008;26:3552-3559; NSCLC Meta-analysis Collaborative Group. *Lancet*. 2014;383:1561-1571.

Q3: Chemo(platinum)-Free Alternatives?



Non-cancer deaths / person years by period	Years 0-3	Years 4-5	Years ≥ 6
Control	88 / 4,353	42 / 1,389	9 / 611
Chemotherapy	141 / 4,638	38 / 1,611	24 / 708
Cancer deaths by period			
Control	878	197	40
Chemotherapy	716	166	52

More non–cancer-related death after adjuvant chemotherapy?

Pignon JP, et al. *J Clin Oncol.* 2008;26:3552-3559.

Q4: Predictive Value of Adenocarcinoma Growth Pattern

		Dominant growthpattern of biopsy					
		Lepidic	Acinary	Micropapillary	Papillary	Solid	Total
Dominant growthpattern of resection	Lepidic	30 (93.8%); p=0.000*	2 (6.2%); p=0.000*	0 (0.0%); p=1*	0 (0.0%); p=1*	0 (0.0%); p=0.000*	32 (100%)
	Acinary	14 (21.9%); p=0.000	42 (65.6%); p=0.000	0 (0.0%); p=0.488*	1 (1.6%); p=1*	7 (10.9%); p=0.01	64 (100%)
	Micropapillary	3 (100%); p=0.057*	0 (0.0%); p=0.29*	0 (0.0%); p=1*	0 (0.0%); p=1*	0 (0.0%); p=1*	3 (100%)
	Papllary	1 (50%); p=1*	0 (0.0%); p=0.527*	0 (0.0%); p=1*	1 (50%); p=0.031*	0 (0.0%); p=1*	2 (100%)
	Solid	1 (4.2%); p=0.000*	3 (12.5%); p=0.000*	1 (4.2%); p=0.192*	0 (0.0%); p=0.192*	19 (79.2%); p=0.000	24 (100%)
	Total	49 (39.2%)	47 (37.6%)	1 (0.8%)	2 (1.6%)	26 (20.8)	125 (100%)

Conclusion neo-adjuvant therapy for resectable NSCLC

Erasmus MC Cancer Institute

Neo-adjuvant

- Feasible
- Impressive pCR ~ DFS ---→> OS?
- Resectable stage IIIa (~ CRT?)

- Strategy in case no pCR/MPR / no ctDNA clearance?
- Adjuvant treatment required?

Future:

- Personalized treatment of early stage NSCLC
- MDT including all involved specialists!
- Primary resectability / N2 disease

Different treatment for patients with driver mutations:
NGS – PD-L1 required in all patients before starting treatment!
TISSUE

THANK YOU FOR YOUR ATTENTION!

Declaration of interest

I have received education grants, provided consultation, attended advisory boards and/or provided lectures for the following organizations, from whom I have received honoraria:

Consultation / Advisory role / Speakers' Bureau:

AstraZeneca, Boehringer Ingelheim, Bristol-Myers Squibb, Eli Lilly, Janssen, Merck Sharp and Dohme, Merck Serono, Novartis, Pfizer, Roche/Genentech, MundiPharma, Daiichi Sankyo

Talk in a company's organized public event supported by:

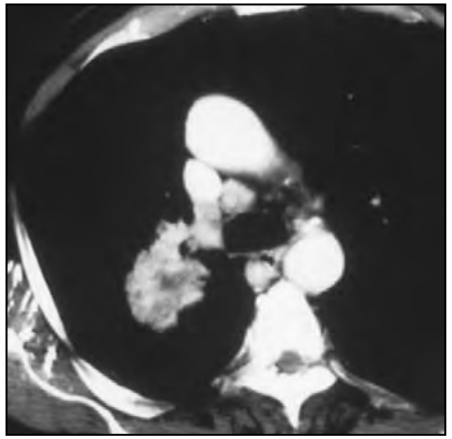
AstraZeneca, Boehringer Ingelheim, Daiichi Sankyo, Eli Lilly, eCancer, Medscape, Takeda, Jansenn , Merck Sharp and Dohme

Receipt of grants/research supports:

(Sub)investigator in trials (institutional financial support for clinical trials) sponsored by AstraZeneca, Boehringer Ingelheim, Janssen, Bristol-Myers Squibb, Eli Lilly, Janssen, Merck Sharp and Dohme, Merck Serono, Mirati, Pfizer, Roche/Genentech, RMC, Daiichi Sankyo

Member of Steering Committee for trials of: Jansenn & ArriVent Biopharma

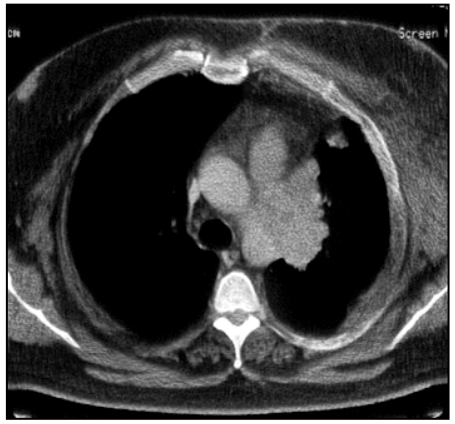
Stage III: many realities (T, N)



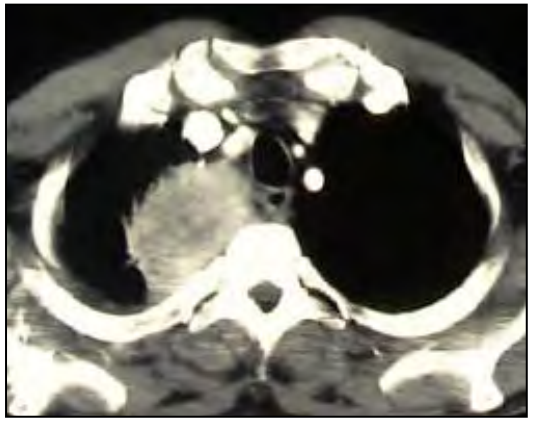
N2 non- bulky (IIIA)

N2 bulky (IIIA)

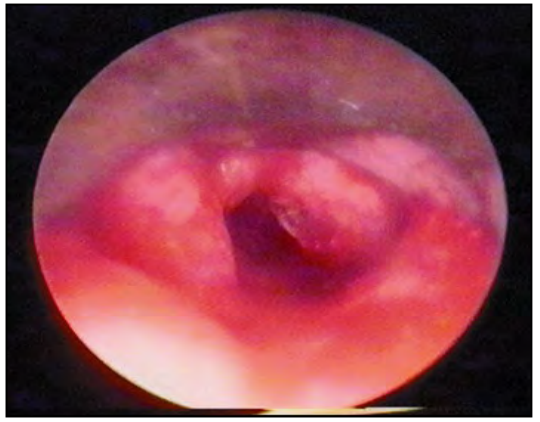
N3 (IIIB)



T4
(mediastinal infiltration)



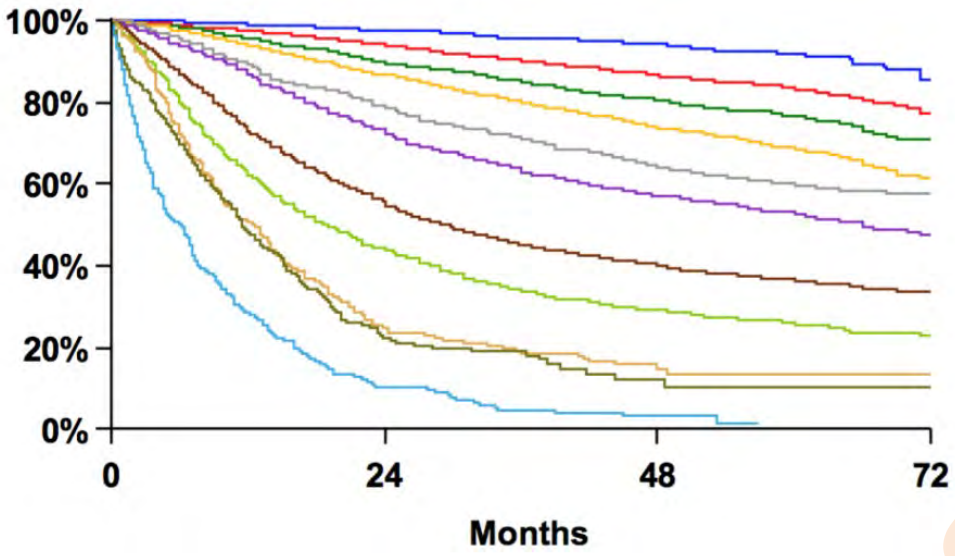
T4
(Chest Wall infiltration)



T4
(tracheal infiltration)

Unresectable stage III NSCLC

- SoC for patients with unresectable, Stage III NSCLC has been platinum-based CRT[1]
- **However, outcomes have been poor with ~15% to 30% of patients alive at 5 years**[1,2]



Proposed	Events / N	MST	24 Month	60 Month
IA1	68 / 781	NR	97%	92%
IA2	505 / 3105	NR	94%	83%
IA3	546 / 2417	NR	90%	77%
IB	560 / 1928	NR	87%	68%
IIA	215 / 585	NR	79%	60%
IIB	605 / 1453	66.0	72%	53%
IIIA	2052 / 3200	29.3	55%	36%
IIIB	1551 / 2140	19.0	44%	26%
IIIC	831 / 986	12.6	24%	13%
IVA	336 / 484	11.5	23%	10%
IVB	328 / 398	6.0	10%	0%

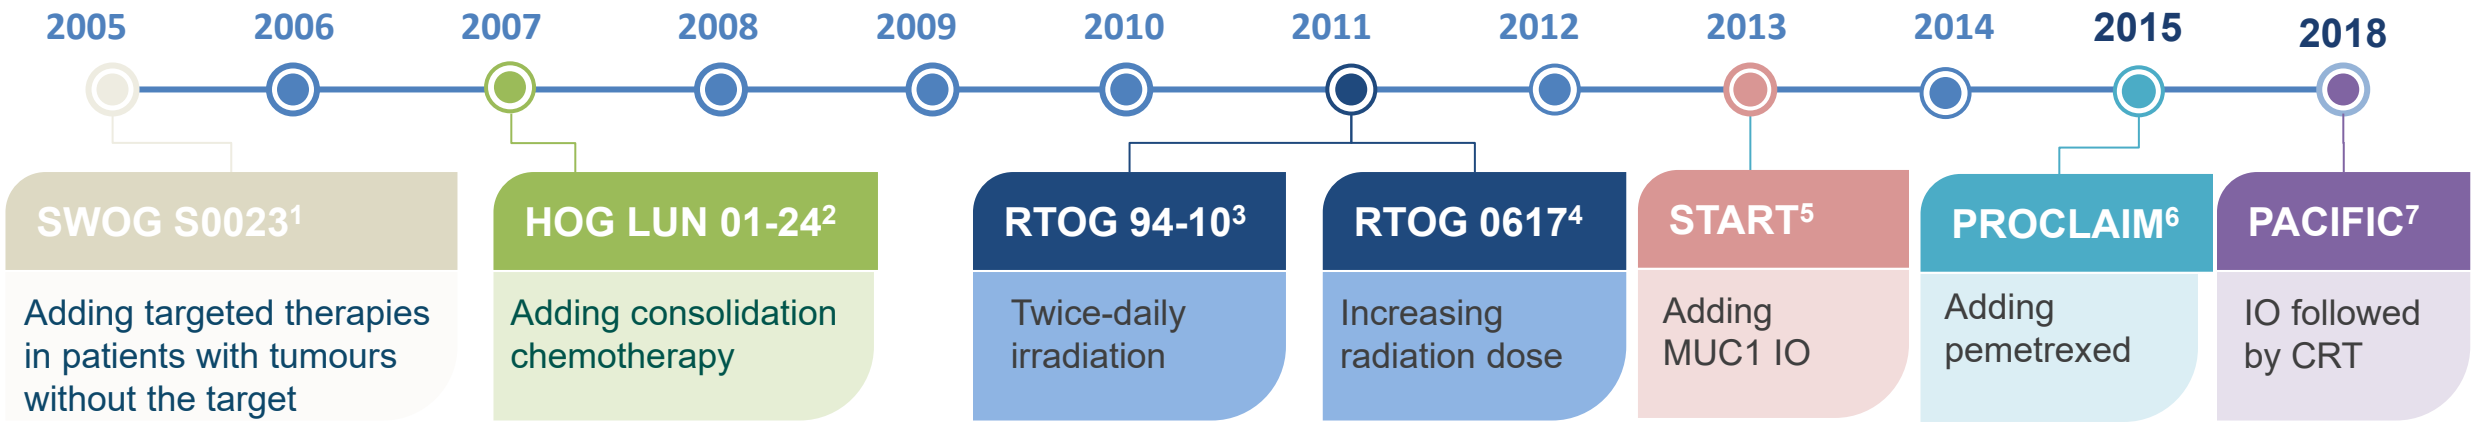
Treatment Approach for Stage III NSCLC Prior to Immuno-Oncology Over the Past 20 Years Has Remained Unchanged



Concurrent chemoradiation therapy[8,9]

Active surveillance

Patients are routinely monitored for disease progression[9]

High unmet need

Several phase 3 trials failed in stage III setting prior to PACIFIC[1-4,10]

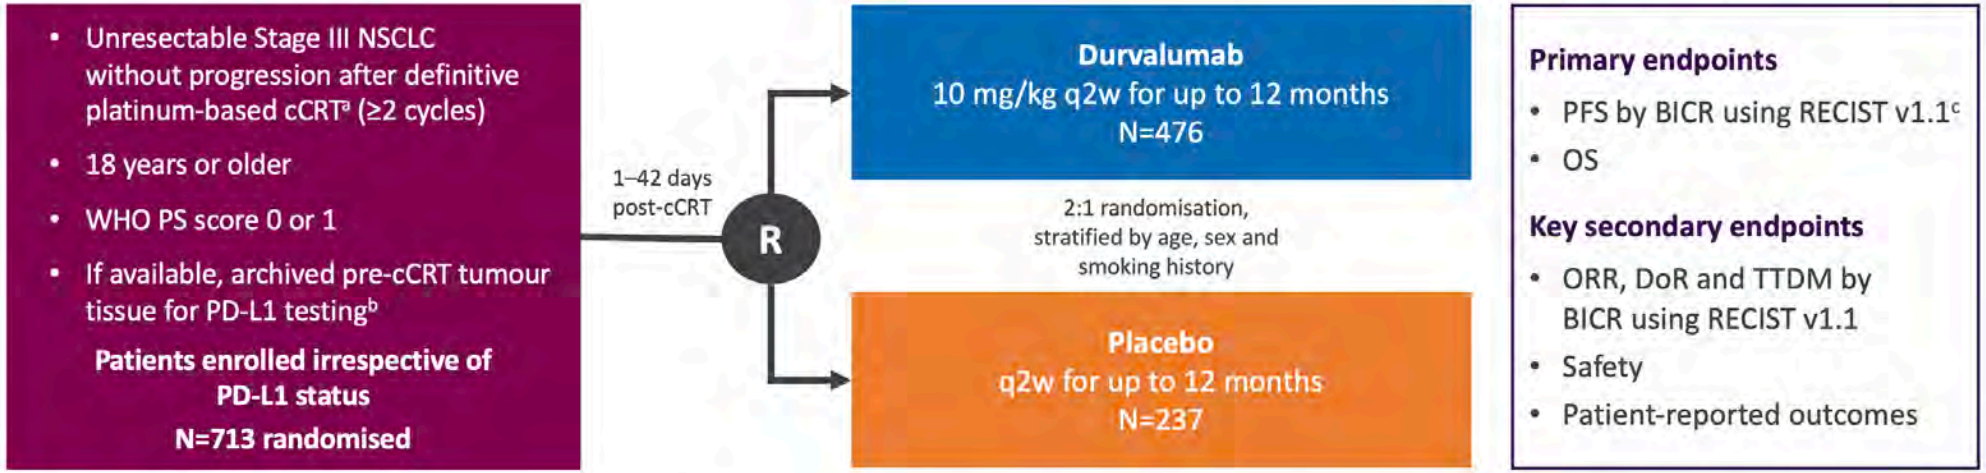
Lorenzo Galluzzi et al. Cancer Immunol Res 2016
Peters, ASCO 2017

Pacific phase 3 trial in unresectable NSCLC



Updated analyses of OS and PFS, assessed ~5 years after the last patient was randomised (data cut-off: 11 January 2021; exploratory, post-hoc analysis)

- Treatment effects were estimated using stratified log-rank tests in the ITT population
- Medians and yearly landmark rates were estimated using the Kaplan–Meier method

ClinicalTrials.gov identifier: NCT02125461

[a]Radiation dosage typically 60–66 units of gray in 30–33 fractions; [b]Using the Ventana SP263 immunohistochemistry assay; [c]Defined as the time from randomisation to the date of objective disease progression or death by any cause in the absence of progression

BICR, blinded independent central review; cCRT, concurrent chemoradiotherapy; DoR, duration of response; ITT, intent-to-treat; ORR, objective response rate; PD-L1, programmed cell death ligand-1; PS, performance status; q2w, every 2 weeks; RECIST, Response Evaluation Criteria in Solid Tumors; TTDM, time to distant metastasis; WHO, World Health Organization

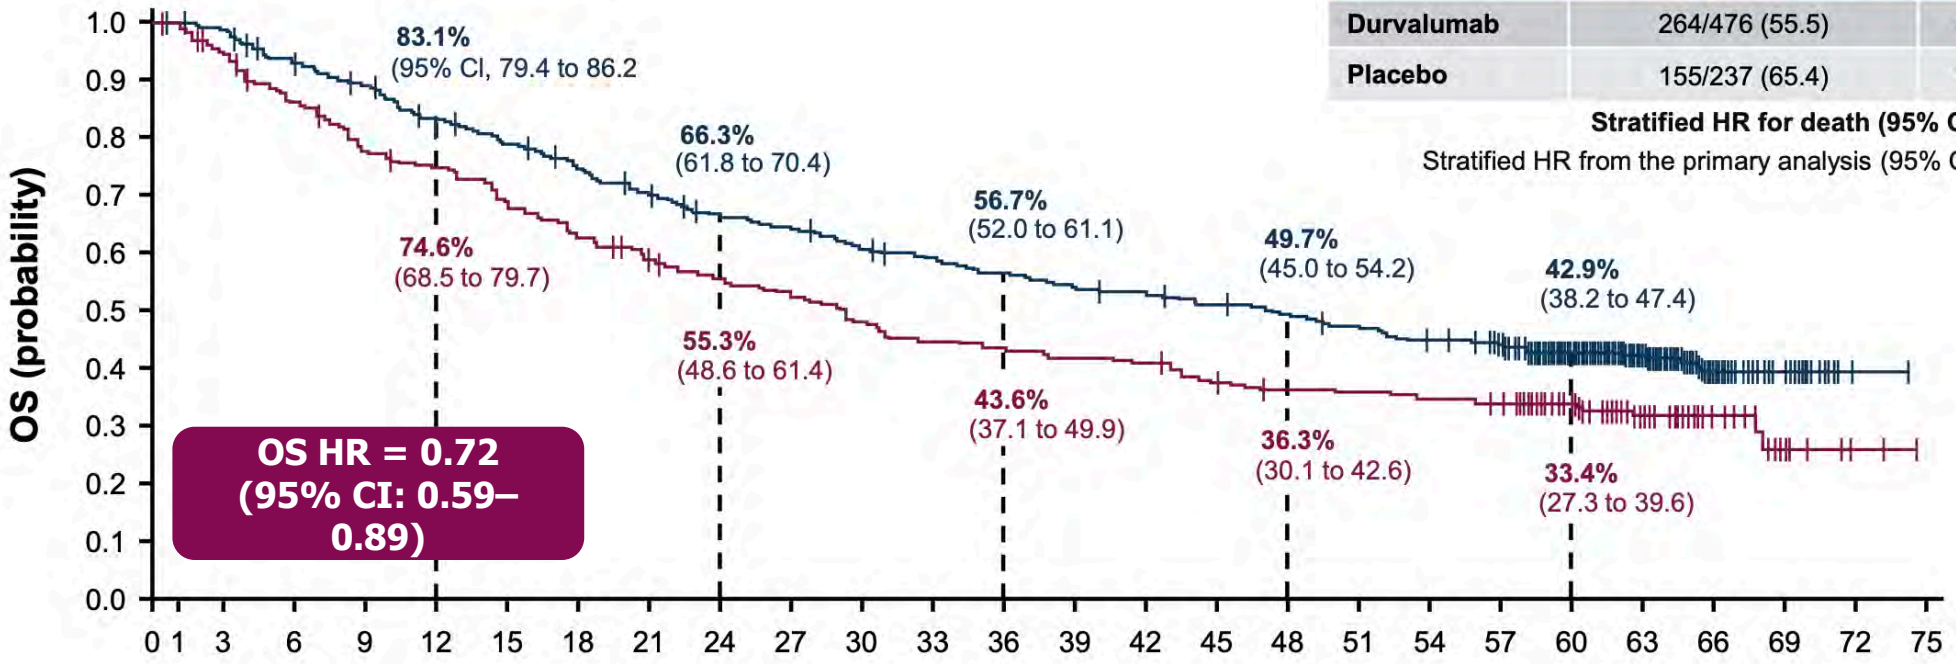
Spigel et al. Presented at ASCO 2021, Poster 8511

Updated OS results of PACIFIC trial

Arm	No. of events / No. of patients (%)	Median OS (95% CI) months
Durvalumab	264/476 (55.5)	47.5 (38.1–52.9)
Placebo	155/237 (65.4)	29.1 (22.1–35.1)

Stratified HR for death (95% CI): 0.72 (0.59–0.89)

Stratified HR from the primary analysis (95% CI): 0.68 (0.53–0.87)



No. at risk

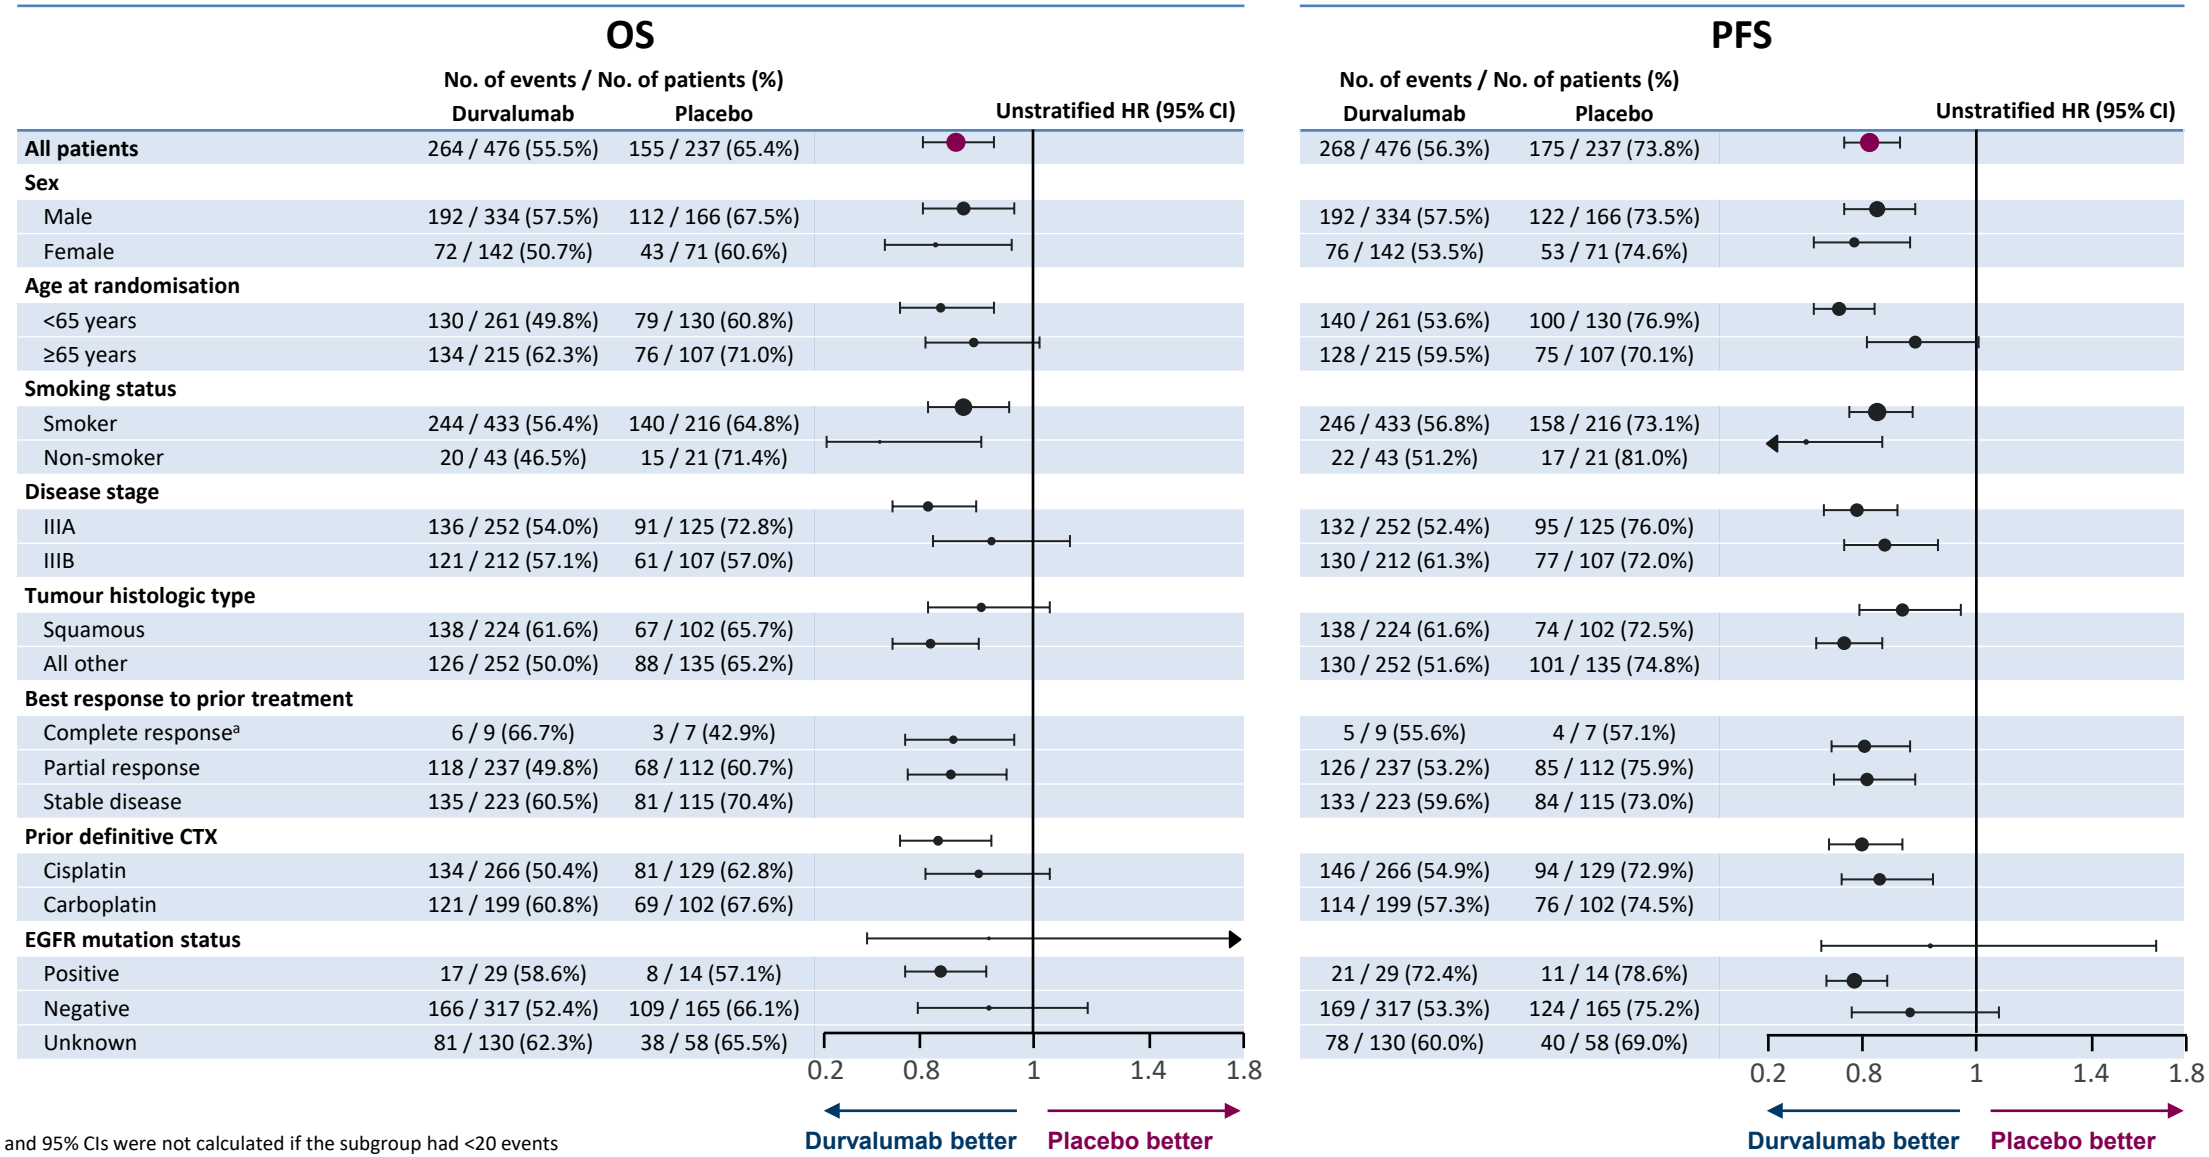
Durva.	476	464	431	414	385	364	343	319	298	289	273	264	252	241	236	227	218	207	196	183	134	91	40	18	2	0
Placebo	237	220	199	179	171	156	143	133	123	116	107	99	97	93	91	83	78	77	74	72	56	33	16	7	2	0

DCO5: January 11, 2021; median follow-up: all patients, 34.2 months [range, 0.2–74.7]; censored patients, 61.6 months [range, 0.4–74.7].

CI = confidence interval; DCO = data cutoff; HR = hazard ratio; ITT = intention-to-treat; OS = overall survival.

Spigel D et al. Online ahead of print. *J Clin Oncol. 2022.*

Updated OS and PFS in prespecified subgroups



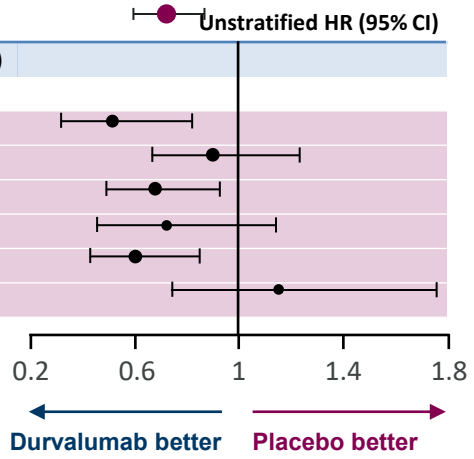
[a]HRs and 95% CIs were not calculated if the subgroup had <20 events

CTX, chemotherapy; EGFR, epidermal growth factor receptor

Updated OS and PFS in PD-L1 subgroups

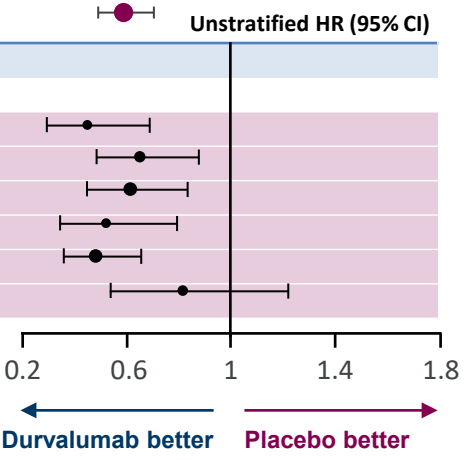
OS

	No. of events / No. of patients (%)	
	Durvalumab	Placebo
All patients	264 / 476 (55.5%)	155 / 237 (65.4%)
PD-L1 expression level		
≥25%	51 / 115 (44.3%)	27 / 44 (61.4%)
<25%	111 / 187 (59.4%)	64 / 105 (61.0%)
Unknown	102 / 174 (58.6%)	64 / 88 (72.7%)
1–24% (post-hoc analysis)	52 / 97 (53.6%)	29 / 47 (61.7%)
≥1% (post-hoc analysis)	103 / 212 (48.6%)	56 / 91 (61.5%)
<1% (post-hoc analysis)	59 / 90 (65.6%)	35 / 58 (60.3%)



PFS

	No. of events / No. of patients (%)	
	Durvalumab	Placebo
264 / 476 (55.5%)	**155 / 237 (65.4%)**	
61 / 115 (53.0%)	33 / 44 (75.0%)	
105 / 187 (56.1%)	77 / 105 (73.3%)	
102 / 174 (58.6%)	65 / 88 (73.9%)	
50 / 97 (51.5)	36 / 47 (76.6%)	
111 / 212 (52.4%)	69 / 91 (75.8%)	
55 / 90 (61.1%)	41 / 58 (70.7%)	

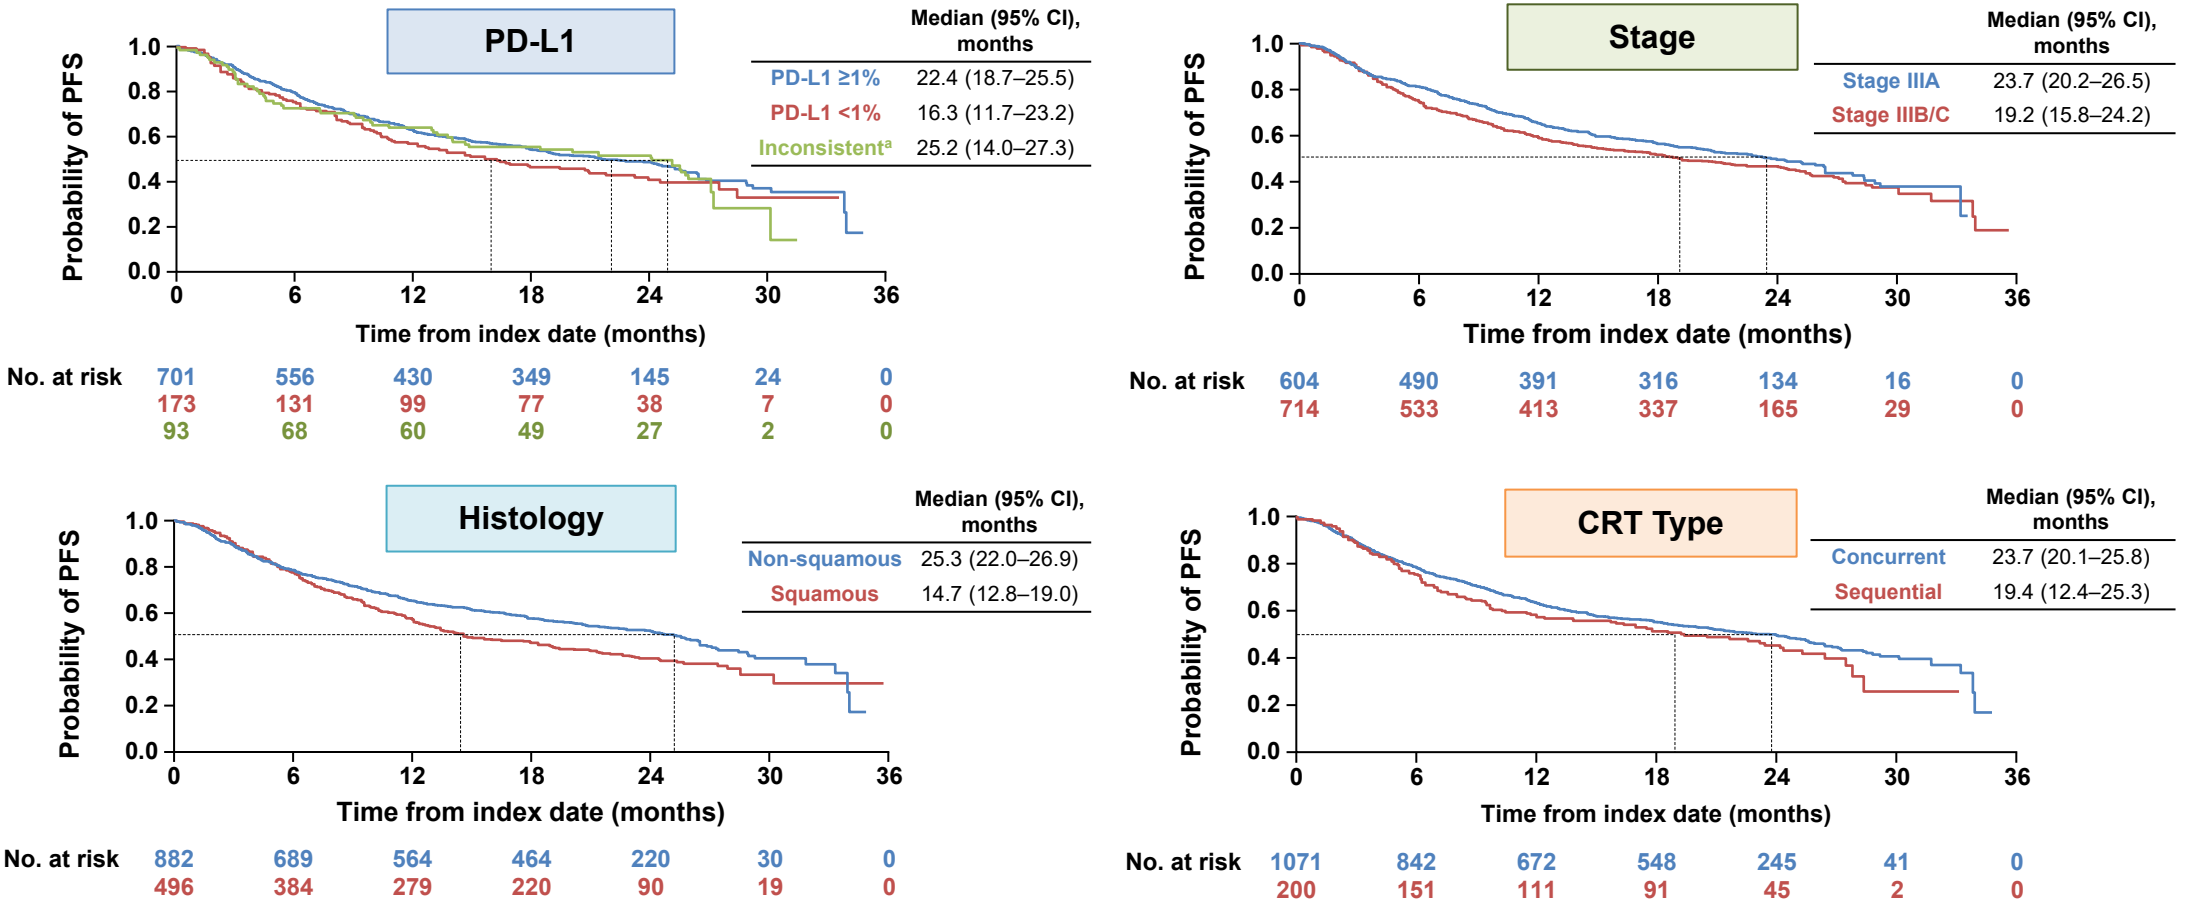


- Updated OS and PFS for subgroups were consistent with the results reported at the time of the primary analyses [1,2]

1. Antonia SJ, et al. New Engl J Med 2018;379:2342–50. 2.Antonia SJ, et al. New Engl J Med 2017;377:1919–29.

PACIFIC-R: Real-world PFS by Subgroup

- The effectiveness of durvalumab after CRT in the analyzed subgroups was generally consistent[1] with previous analyses from the PACIFIC trial[2] including PD-L1 subgroups.[3]



DCO 8 April, 2021.

[a]PD-L1 expression tested but not clearly reported.

CI = confidence interval; CRT = chemoradiotherapy; DCO = data cutoff; PD-L1 = programmed death ligand-1; PFS = progression-free survival.

*ND, based on curves.
**7.9% (*Three dimensional (3D) conformal radiation therapy* 3DRT) *versus* 3.5% (IMRT) in the whole trial.

J. Remon, TAMO2022

Timing of IO: concurrent plus consolidation

	Investigational arm		
EA 5181	CT-RT + Durvalumab	→	Durvalumab for 1 year
PACIFIC 2	CT-RT + Durvalumab	→	Durvalumab 1500 q4w, until PD
KEYLYNK-012	CT-RT + Pembrolizumab	→	Pembrolizumab for 1 year +/- Olaparib
CheckMate 73L	CT-RT + Nivolumab	→	Nivolumab +. Ipilimumanb for 1 year
		→	Nivolumab for 1 year

How to improve the *Pacific* results?

Optimizing the use of IO in stage III?

Timing of IO + CT/RT

Duration of IO

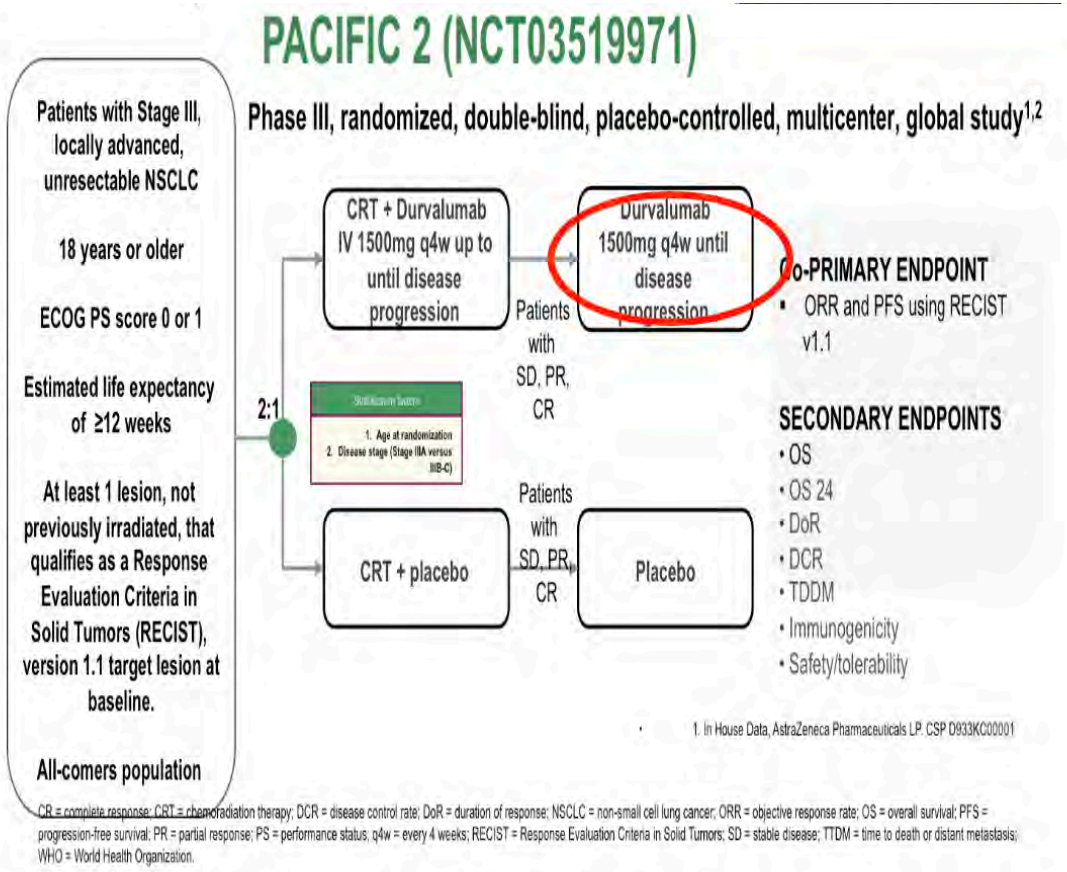
New agents?

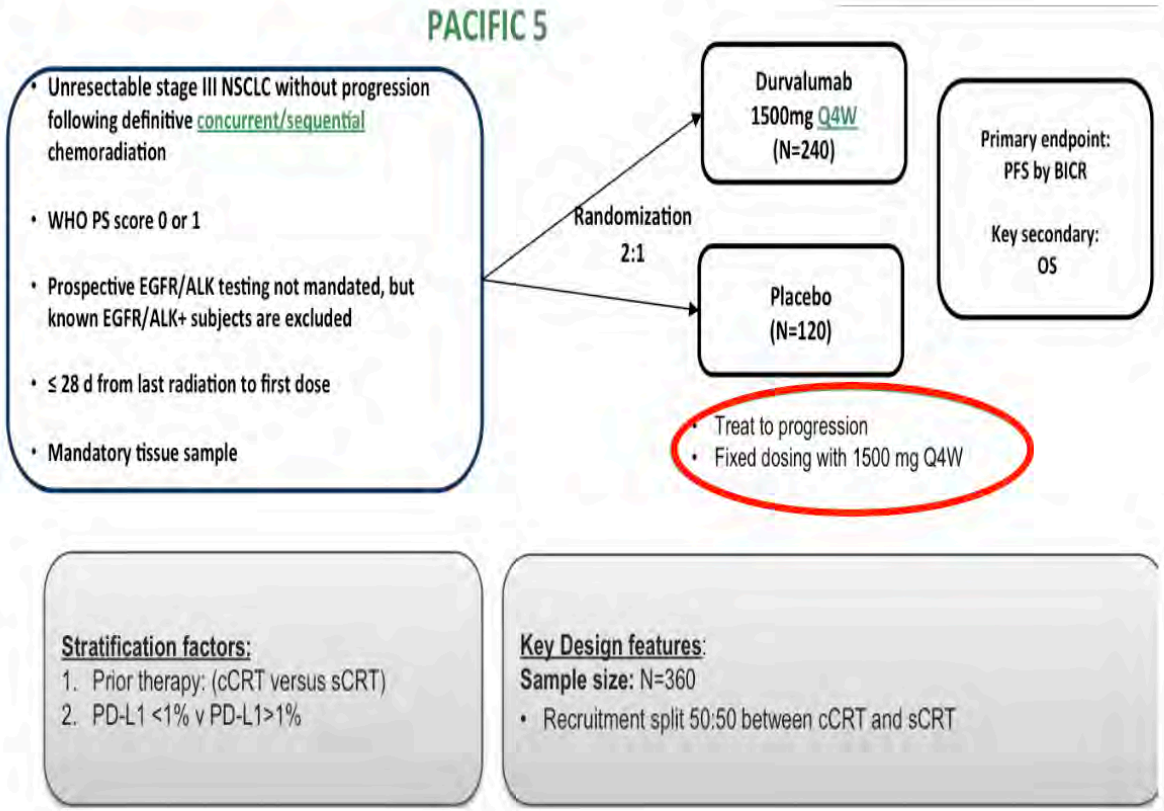
Evaluation new agents and combination

Predictive biomarkers?

Duration of IO: clinical relevant question

not addressed in current & ongoing clinical trial





How to improve the *Pacific* results?

Optimizing the use of IO in stage III?

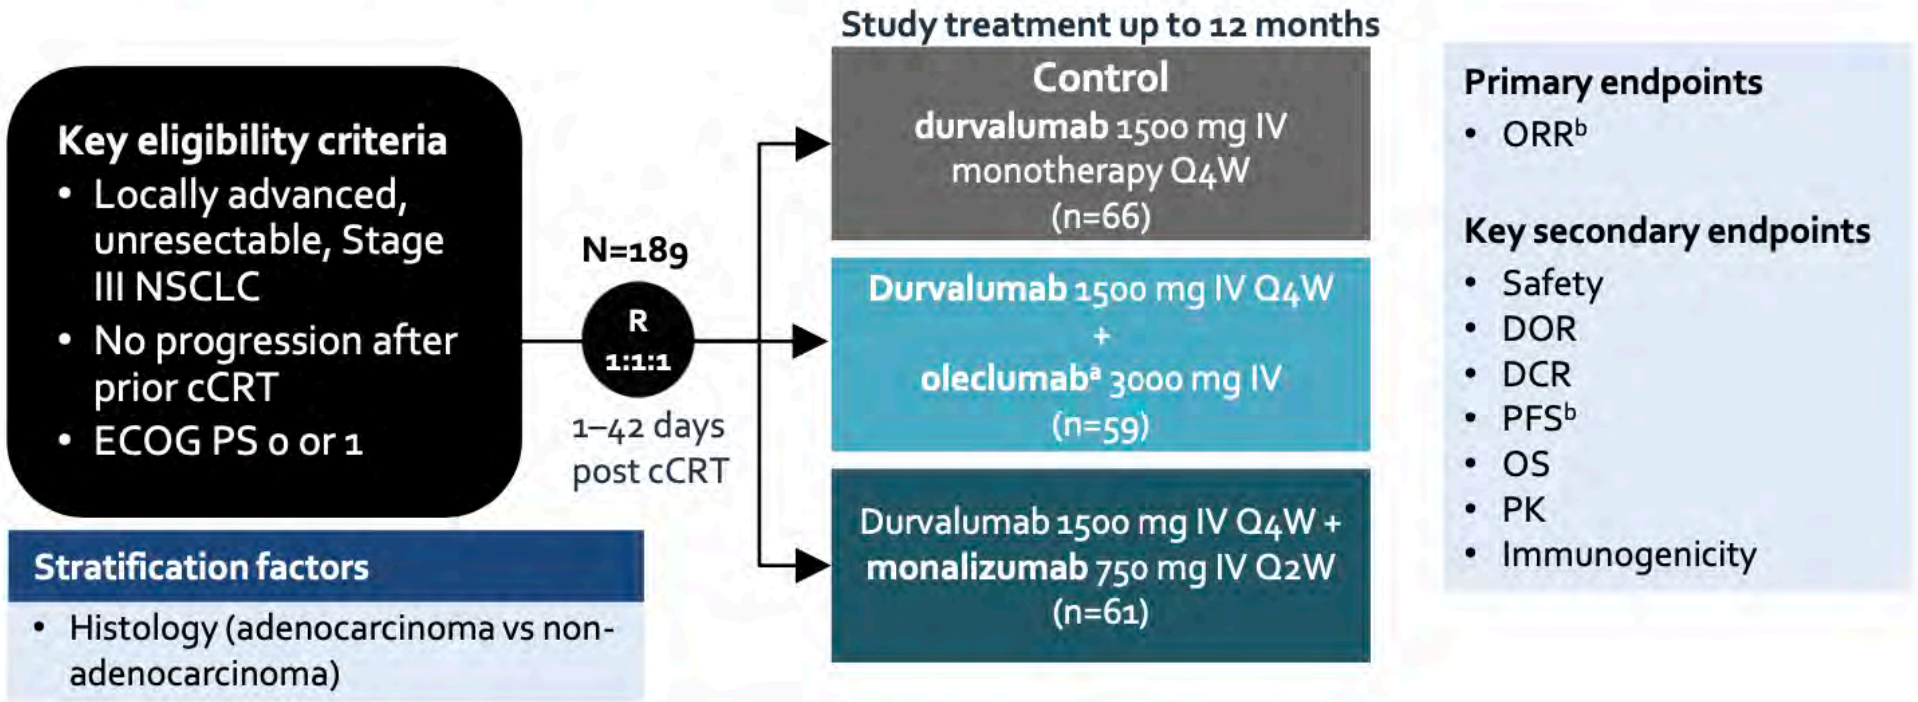
- Timing of IO + CT/RT
- Duration of IO

New agents?

Evaluation new agents and combination

Predictive biomarkers?

COAST (Phase 2, open label): Durvalumab ± novel agents in patients with locally advanced, unresectable, Stage III NSCLC



Monalizumab is a humanized IgG4 that inhibits NKG2A, an inhibitory cell surface receptor covalently bound to CD94, and expressed on tumor infiltrating NK cells and CD8 + T cells, which interacts with HLA-E

Oleclumab is a mAb that binds to CD73 and inhibits production of immunosuppressive adenosine

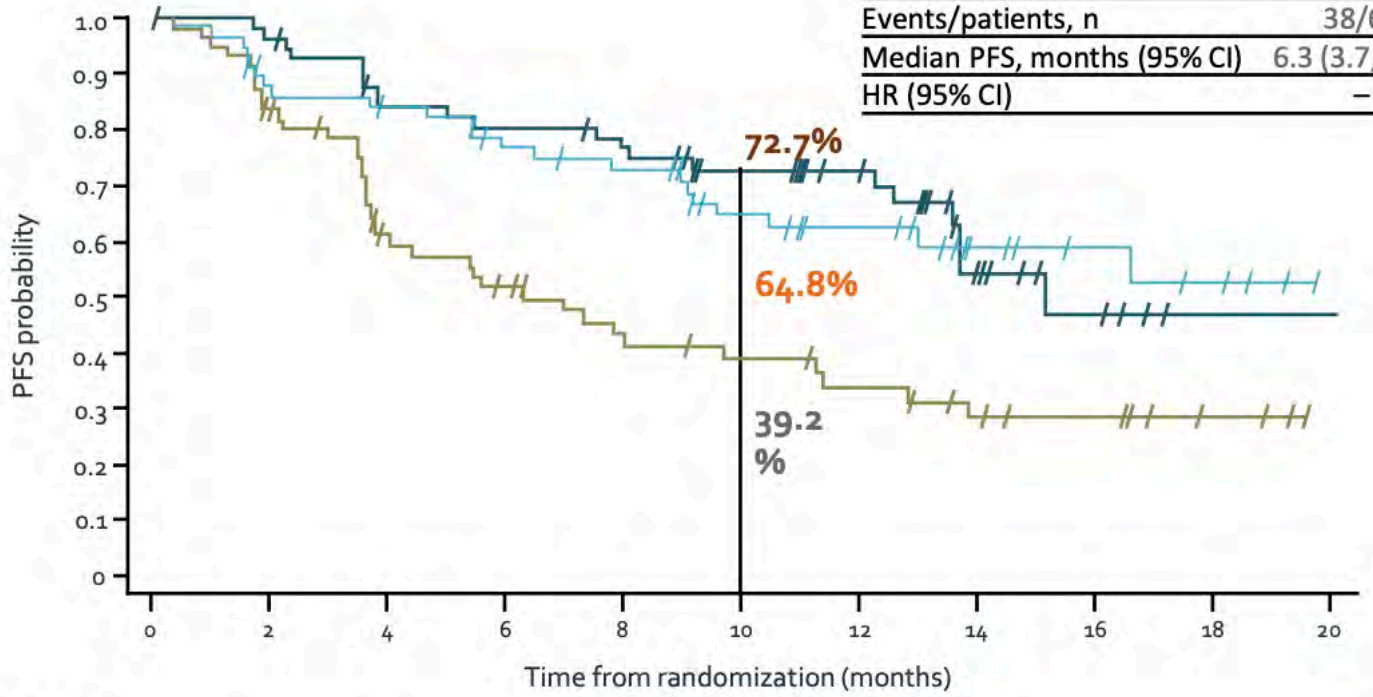
[a]Oleclumab Q2W for cycles 1 and 2 then Q4W; [b]Investigator assessment by RECIST v1.1. cCRT, concurrent chemoradiotherapy; DCR, disease control rate; DOR, duration of response; ECOG PS, Eastern Cooperative Oncology Group performance status; NK, natural killer; ORR, objective response rate; PK, pharmacokinetics.

Martinez-Marti A, et al. ESMO 2021. Abstract LBA42.

COAST: Investigator assessed PFS

PFS: interim analysis (ITT population)

	Durvalumab	Durvalumab + oleclumab	Durvalumab + monalizumab
Events/patients, n	38/67	22/60	21/62
Median PFS, months (95% CI)	6.3 (3.7, 11.2)	NR (10.4, NE)	15.1 (13.6, NE)
HR (95% CI)	–	0.44 (0.26, 0.75)	0.65 (0.49, 0.85)



No. at risk											
Durvalumab	67	50	32	32	20	16	13	9	7	3	0
Durvalumab + oleclumab	60	49	46	40	37	30	22	13	9	5	0
Durvalumab + monalizumab	62	55	46	44	41	35	25	11	6	1	1

ORRs:

- Durvalumab: 18%
- Durvalumab + oleclumaba: 30%
- Durvalumab + monalizumab: 36%

- ORR and PFS improved with both dual checkpoint inhibitor approaches
- Propensity weighting analysis shows superimposable data to PACIFIC
- Very encouraging data

Martinez-Marti A, et al. ESMO 2021. Abstract LBA42.

GEMSTONE-301 (Phase 3): Sugemalimab in patients with unresectable Stage III NSCLC without progression after chemotherapy

Key eligibility criteria

- Patients with unresectable Stage III NSCLC who have not progressed following cCRT or sCRT
- ECOG PS 0– 1
- No known sensitizing *EGFR*, *ALK*, or *ROS1* genomic alterations

N=368

R 2:1

1–42 days post cCRT/sCRT

Sugemalimab 1200 mg IV Q3W

Placebo IV Q3W

For up to 24 months

Primary endpoints

- PFS

Key secondary endpoints

- PFS
- ORR
- DOR
- Safety
- TTDM
- PK

Stratification factors

- ECOG PS (0 vs 1)
- CRT (cCRT vs sCRT)
- Total RT dose (<60 Gy vs ≥60 Gy)

Statistical considerations

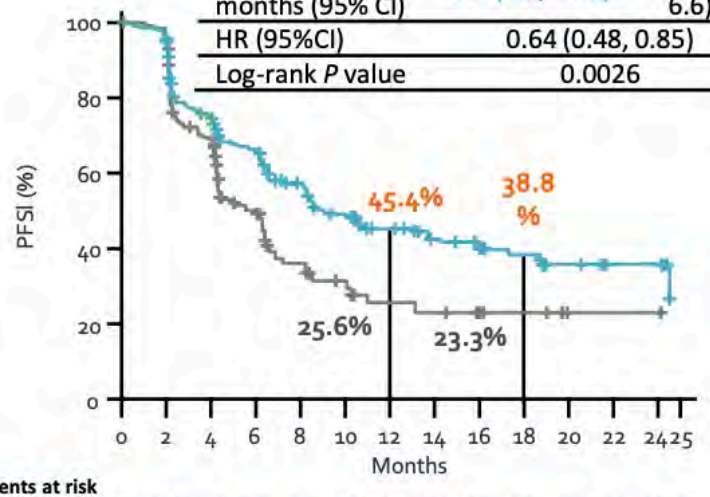
- PFS tested first at a two sided alpha of 0.05; if PFS is significant, then OS would be tested at a two sided alpha of 0.05

Carbone D, et al. WCLC 2021. Abstract OA09.01.

GEMSTONE-301: PFS by BICR and CRT type

PFS by BICR

	Sugemalimab (n=255)	Placebo (n=126)
Median PFS, months (95% CI)	9.0 (8.1, 14.1)	5.8 (4.2, 6.6)
HR (95%CI)	0.64 (0.48, 0.85)	
Log-rank *P* value	0.0026	

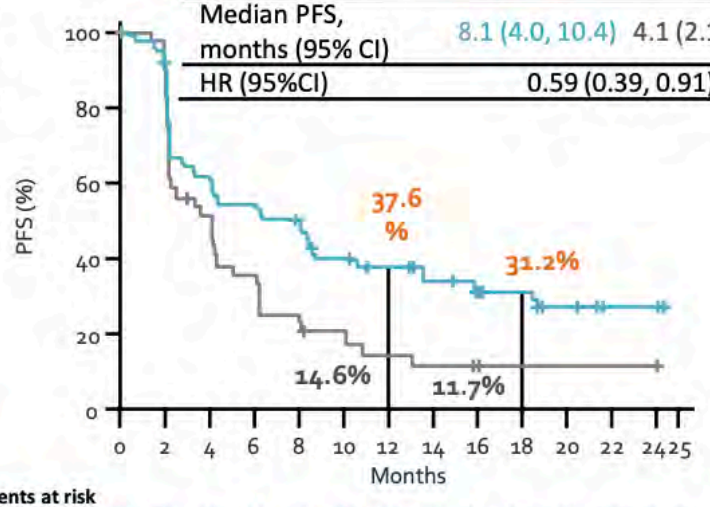


Patients at risk

Sugemalimab	255	225	162	130	96	76	63	48	35	30	20	11	11	0
Placebo	126	115	77	46	25	16	11	10	6	4	1	1	1	0

PFS for patients receiving sCRT

	Sugemalimab (n=86)	Placebo (n=41)
Median PFS, months (95% CI)	8.1 (4.0, 10.4)	4.1 (2.1, 6.1)
HR (95%CI)	0.59 (0.39, 0.91)	

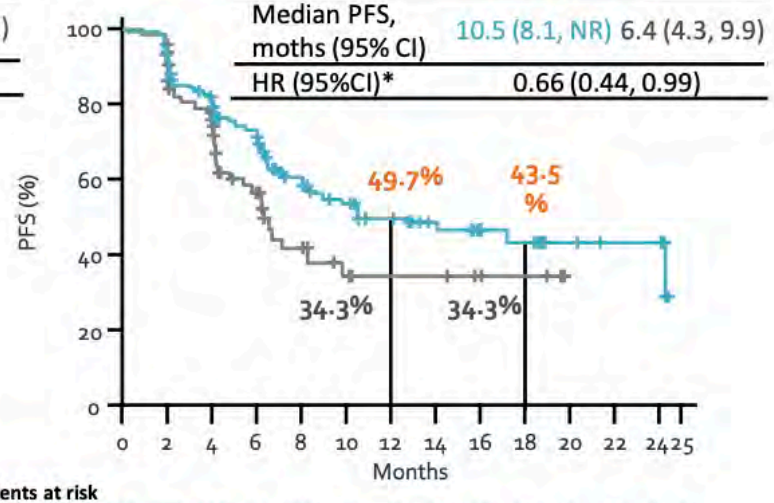


Patients at risk

Sugemalimab	86	73	51	46	41	32	28	22	17	15	11	6	6	0
Placebo	41	37	20	14	10	7	5	4	2	1	1	1	1	0

PFS for patients receiving cCRT

	Sugemalimab (n=169)	Placebo (n=85)
Median PFS, moths (95% CI)	10.5 (8.1, NR)	6.4 (4.3, 9.9)
HR (95%CI)*	0.66 (0.44, 0.99)	



Patients at risk

Sugemalimab	169	152	111	84	55	44	35	25	18	15	9	5	5	0
Placebo	85	78	57	32	15	9	6	6	4	3	0	0	0	0

- Another drug for consolidation therapy post chemo-RT in China (outside of China?)
- First evidence of efficacy post sequential chemo-RT

BICR, blinded independent central review; cCRT, concurrent chemoradiotherapy; sCRT, sequential chemoradiotherapy.

Carbone D, et al. WCLC 2021. Abstract OA09.01.

SKYSCRAPER-3 (800 patients)

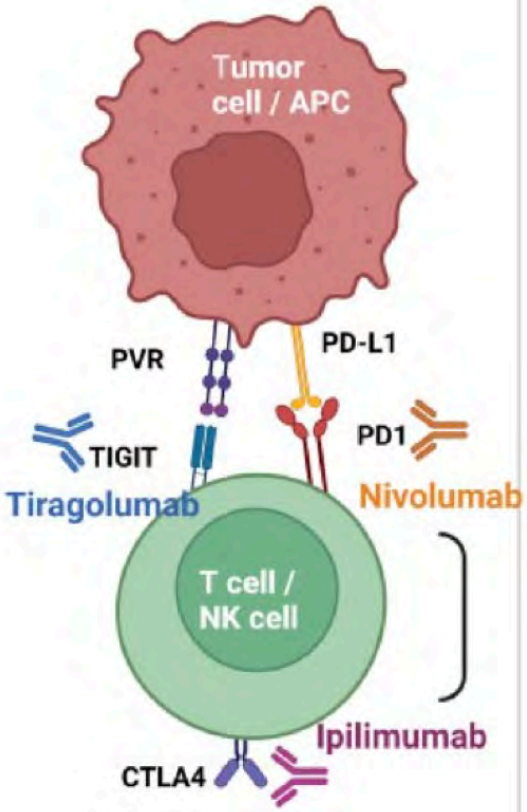
Patient population:
- Locally advanced, unresectable (stage III) NSCLC
- Recived at least 2 cylce of cCRT
- WHO/ECOG performance status 0 or 1

Randomize 1:1

- Atezolizumab and Tiragolumab (Arm A) → **PD**
- Durvalumab consolidation (Arm B) → **PD**

Primary endpoints:
PFS

Key secondary endpoints:
OS



How to improve the *Pacific* results?

Optimizing the use of IO in stage III?

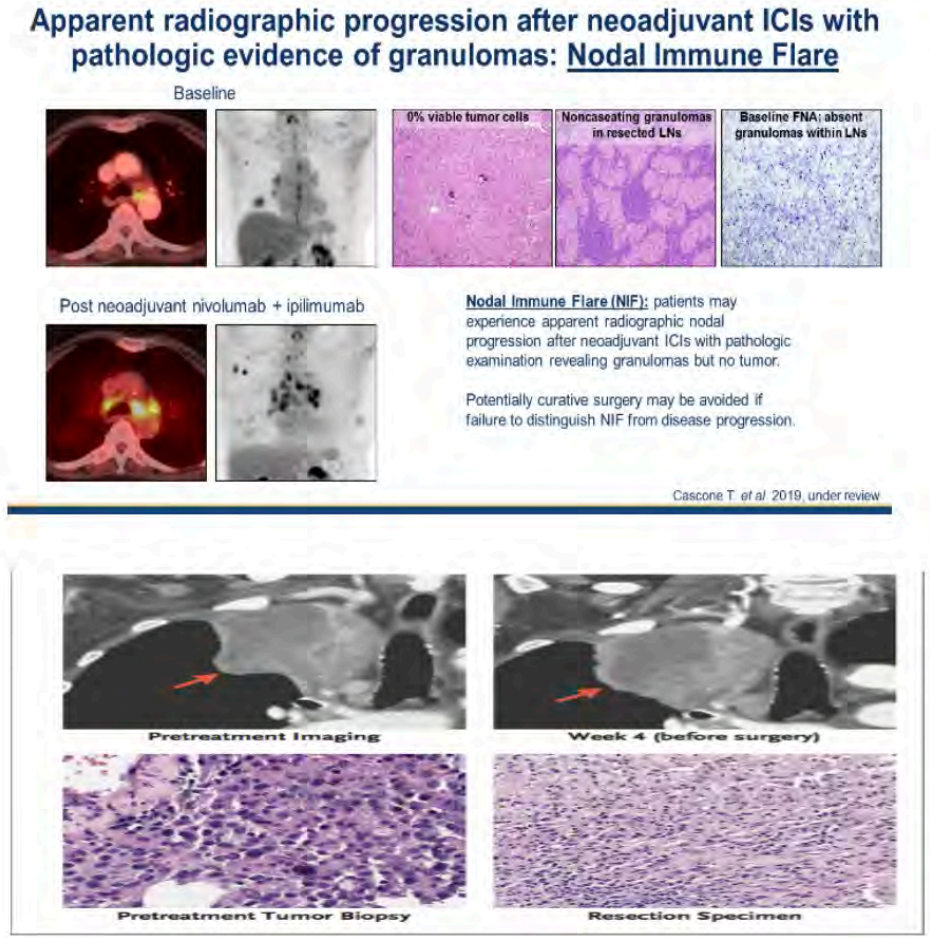
- Timing of IO + CT/RT
- Duration of IO

New agents?

Identifying predictive biomarkers?

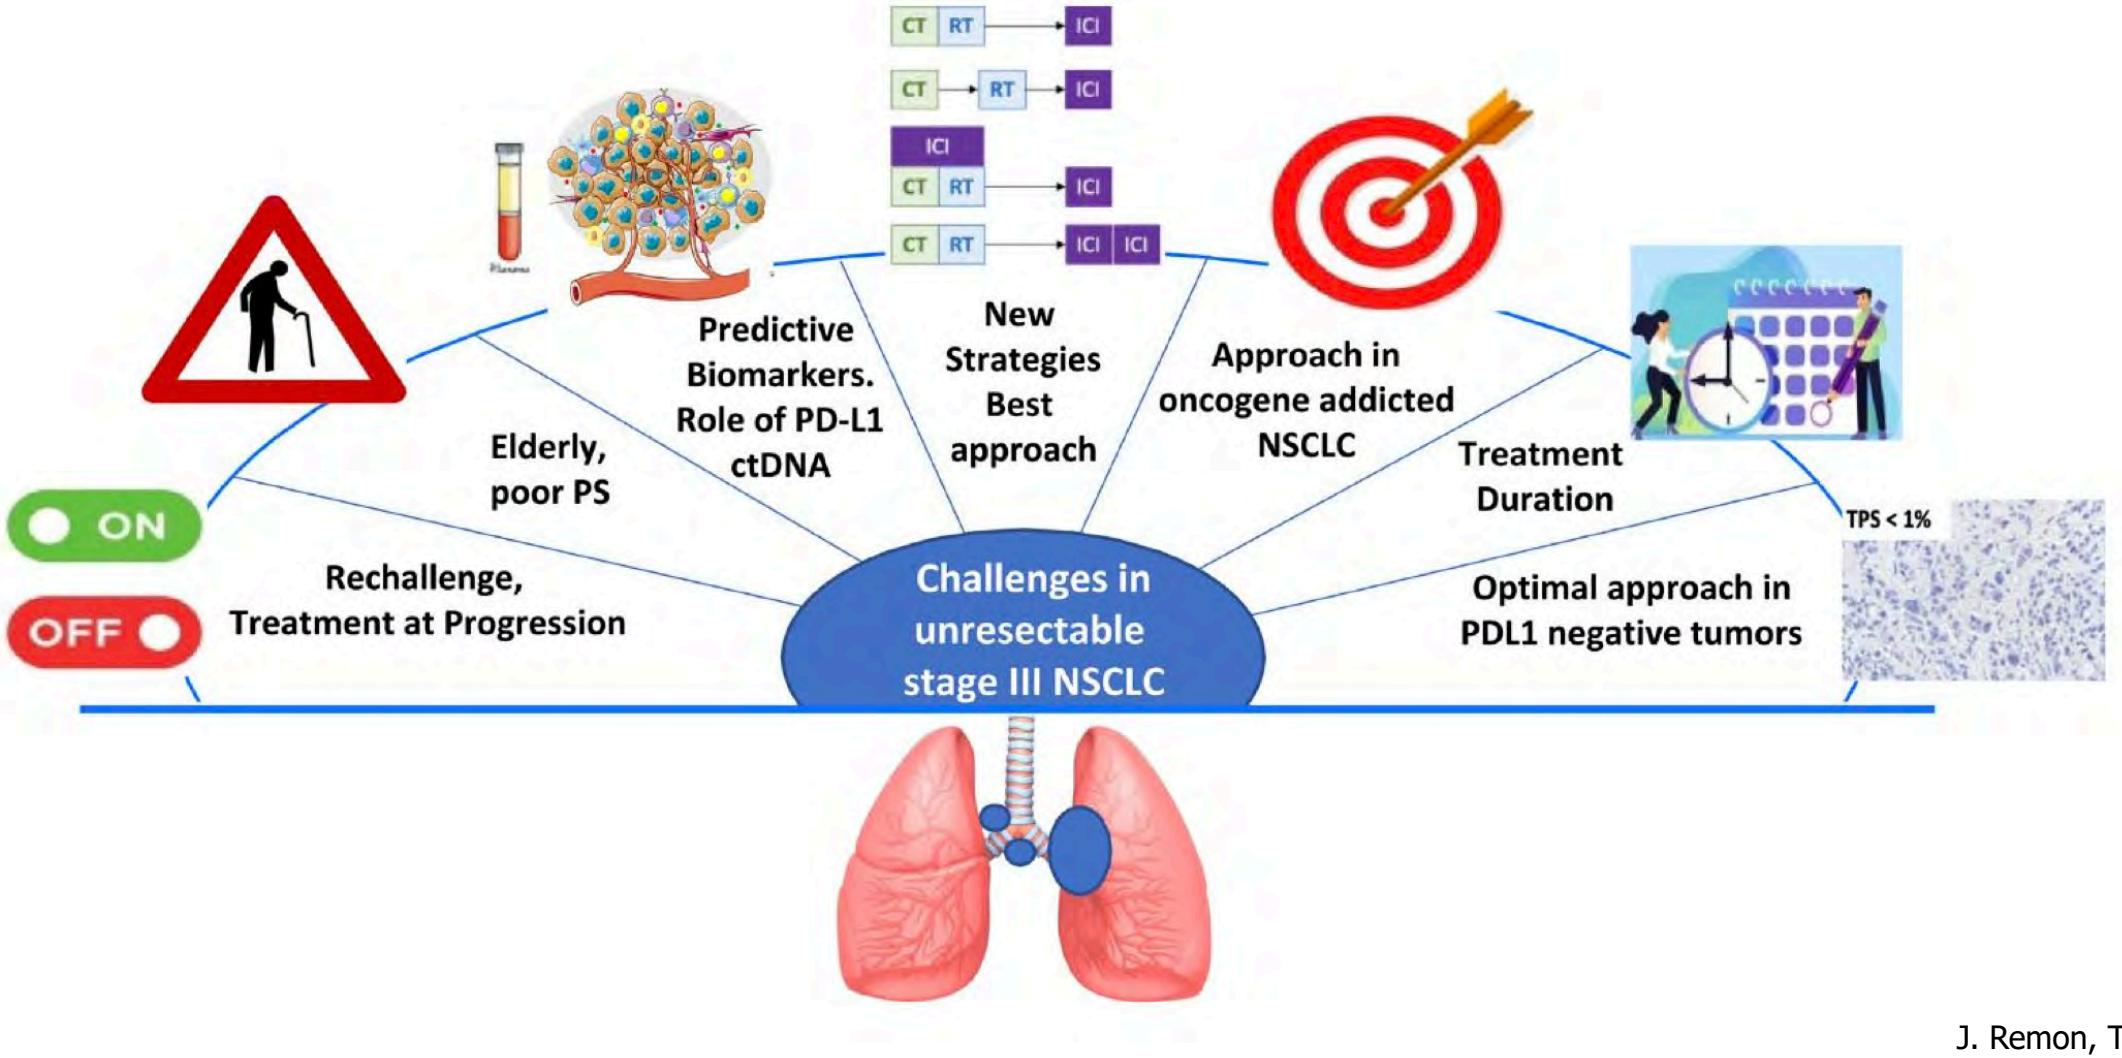
Is clinical response enough to make decision in stage III?

- Different pattern of response under IO:
  - •Pseudo progression, Hyper progression, dissociate responses *(Borcoman E, Ann Oncol 2019)*
  - •Lack of correlation between RECIST and pathologic responses *(Forde, NEJM 2018)*
  - •Nodal Immune Flare? *(Cascone T, ASCO 19)*
- Artificial Intelligence algorithms can automatically quantify radiographic characteristics and may function as non invasive biomarkers for response to IO in advanced NSCLC *(Trebeschi S, Ann Oncol 2019)*
- This research should be expanded to stage III due to the extreme complexity of evaluation of response after CT/RT and IO



P. Garrido, WCLC 2019

Current challenges with ICIs in unresectable stage III NSCLC



J. Remon, TAMO2022

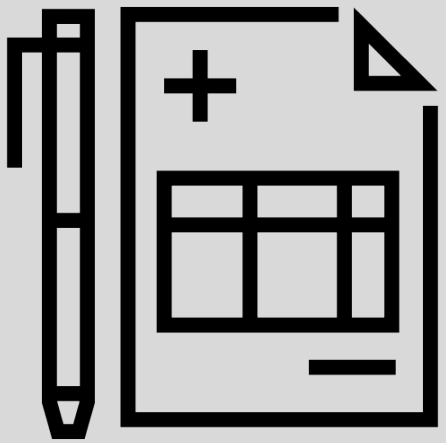
Global Lung Cancer Academy

Debate: Adjuvant vs Neoadjuvant Therapy for NSCLC

Moderator: Corey Langer, MD, FACP

Presenters: Johan Vansteenkiste, MD, PhD, and Benjamin Besse, MD, PhD

Patient case



Patient and disease characteristics

- 70-year-old woman
- Former smoker who quit 20 years ago

Diagnosis

- Stage II NSCLC, lymph-node positive, T2N1M0
- Biopsy shows *P53* mutation positive but no other mutations
- PD-L1 = 15%

What would be your treatment approach for this patient?

- Neoadjuvant therapy
- Adjuvant therapy

Global Lung Cancer Academy

Neoadjuvant Therapy

Johan Vansteenkiste, MD, PhD

Perioperative therapy resectable NSCLC

- Neoadjuvant chemo- or chemoradiotherapy?
- Neoadjuvant chemo- or chemo-immunotherapy?

Perioperative therapy resectable NSCLC
> neoadjuvant chemo- or chemoradiotherapy?

ORIGINAL ARTICLE

Survival after Trimodality Treatment for Superior Sulcus and Central T4 Non-small Cell Lung Cancer

Paul De Leyn, MD, PhD, Johan Vansteenkiste, MD, PhD,† Yolande Lievens, MD, PhD,‡ Dirk Van Raemdonck, MD, PhD,* Philippe Nafteux, MD,* Georges Decker, MD,* Willy Coosemans, MD, PhD,* Herbert Decaluwé, MD,* Johny Moons, MScM,* and Tony Lerut, MD, PhD**

- **Principle: "no need for a double local therapy unless the problem is local"**

- **T-factor: chemoradiotherapy useful**
  - **32 consecutive patients with potentially resectable superior sulcus (cT3-T4) or central cT4 NSCLC in prospective database had induction chemoradiotherapy (2 courses of cisplatin-etoposide) + concurrent RT (45 Gy/1.8 Gy)**
  - **Complete resection rate 78% (25/32). In 74% of the resected patients, there was a complete pathologic response or minimal residual microscopic disease**
  - **With a median follow-up of 26.5 months, 5-year OS was 74% in the intent-to-treat population**

- **N-factor: chemotherapy alone is sufficient**

De Leyn et al, J Thorac Oncol 4:62-68, 2009

Perioperative therapy resectable NSCLC
> neoadjuvant chemo- or chemoradiotherapy?

- **232 patients with stage pathology proven IIIA/N2 NSCLC**
  - **Experimental: 117 patients: 3 courses of cisplatin-docetaxel + RT (44 Gy/2 Gy)**
  - **Control: 115 patients: 3 courses of cisplatin-docetaxel**
  - **Interpretation: Radiotherapy did not add any benefit to induction chemotherapy followed by surgery. We suggest that one definitive local treatment modality combined with neoadjuvant chemotherapy is adequate to treat resectable stage IIIA/N2 NSCLC**

Pless et al, Lancet 386:1049-1056, 2015

Induction chemoradiation in stage IIIA/N2 non-small-cell lung cancer: a phase 3 randomised trial

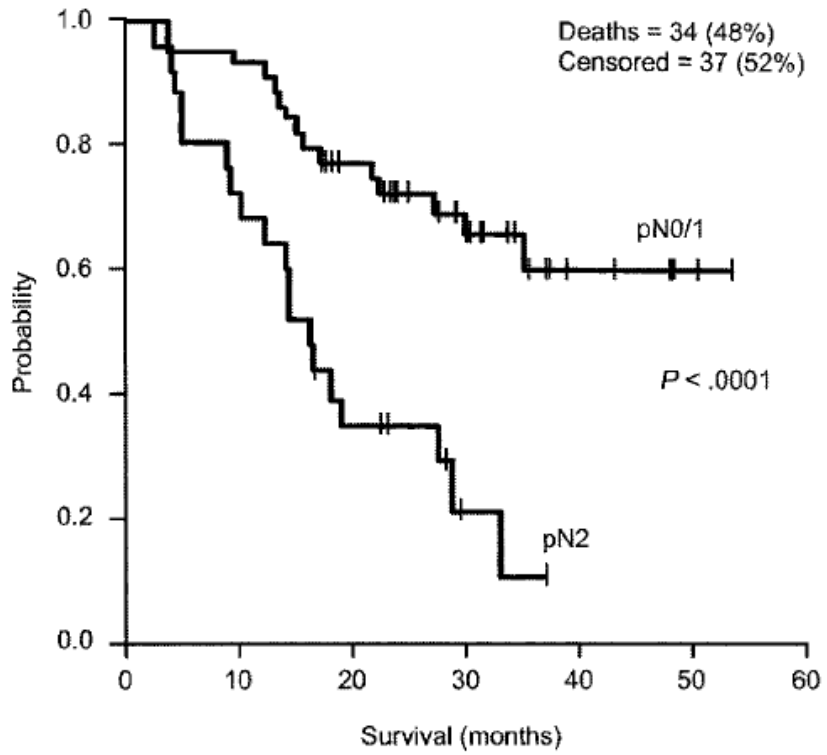
Induction Chemotherapy to Select Candidates for Surgery?

3 Cycles of Docetaxel + Cisplatin in 90 Patients With Potentially Operable Stage IIIA (mediastinoscopy pN2)

Pathologic Downstaging

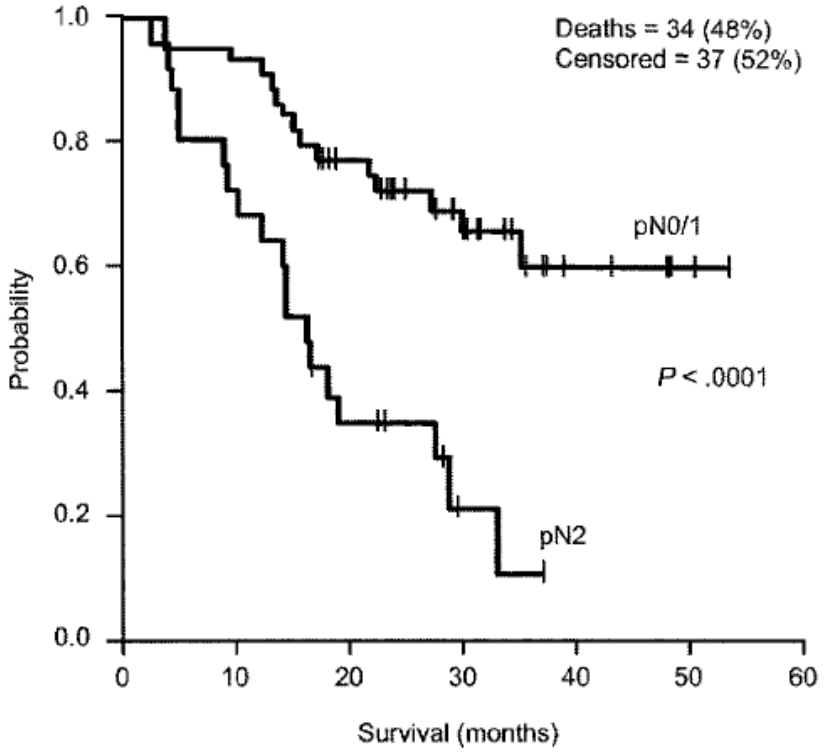


Betticher DC, et al. *J Clin Oncol*. 2003;21:1752-1759.

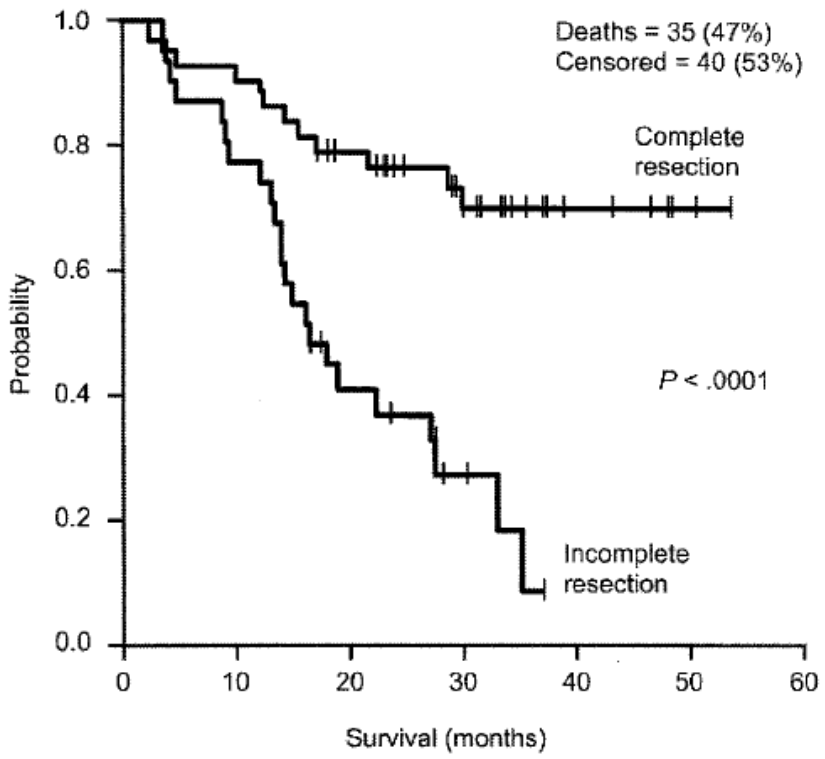
Induction Chemotherapy to Select Candidates for Surgery?

3 Cycles of Docetaxel + Cisplatin in 90 Patients With Potentially Operable Stage IIIA (mediastinoscopy pN2)

Pathologic Downstaging



Complete Resection



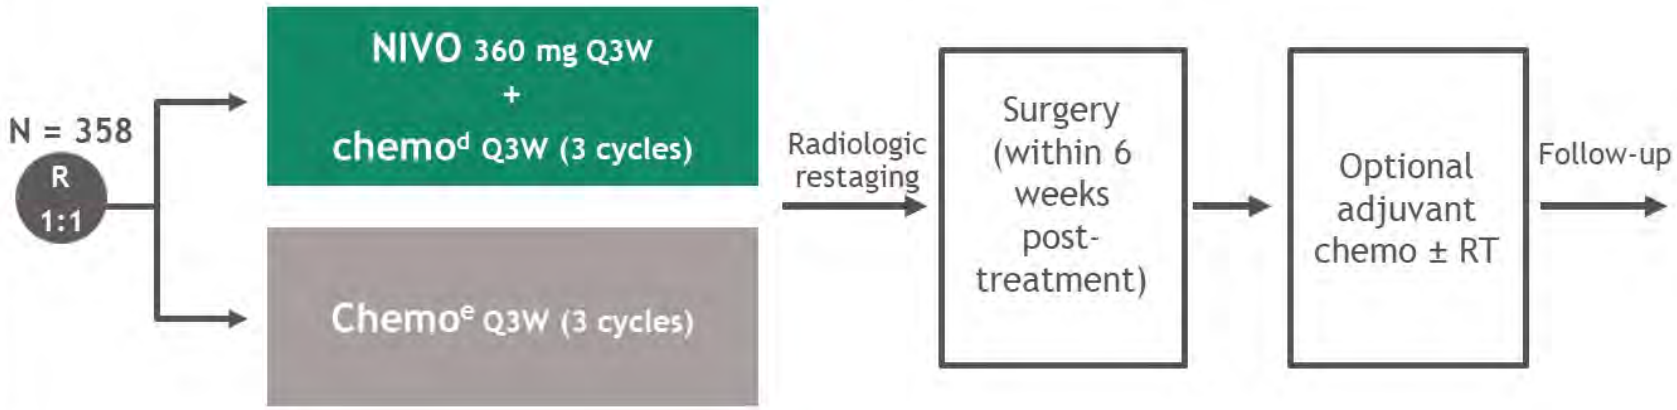
Betticher DC, et al. *J Clin Oncol*. 2003;21:1752-1759.

Neoadjuvant: CheckMate 816

Key eligibility criteria

- Newly diagnosed, resectable, stage IB (≥ 4 cm)-IIIA NSCLC (per TNM 7th edition)
- ECOG PS 0-1
- No known sensitizing *EGFR* mutations or *ALK* alterations

Stratified by stage (IB/II vs IIIA), PD-L1[b] (≥ 1% vs < 1%[c]), and sex



Primary endpoints

- pCR by BIPR
- EFS by BICR

Key secondary endpoints

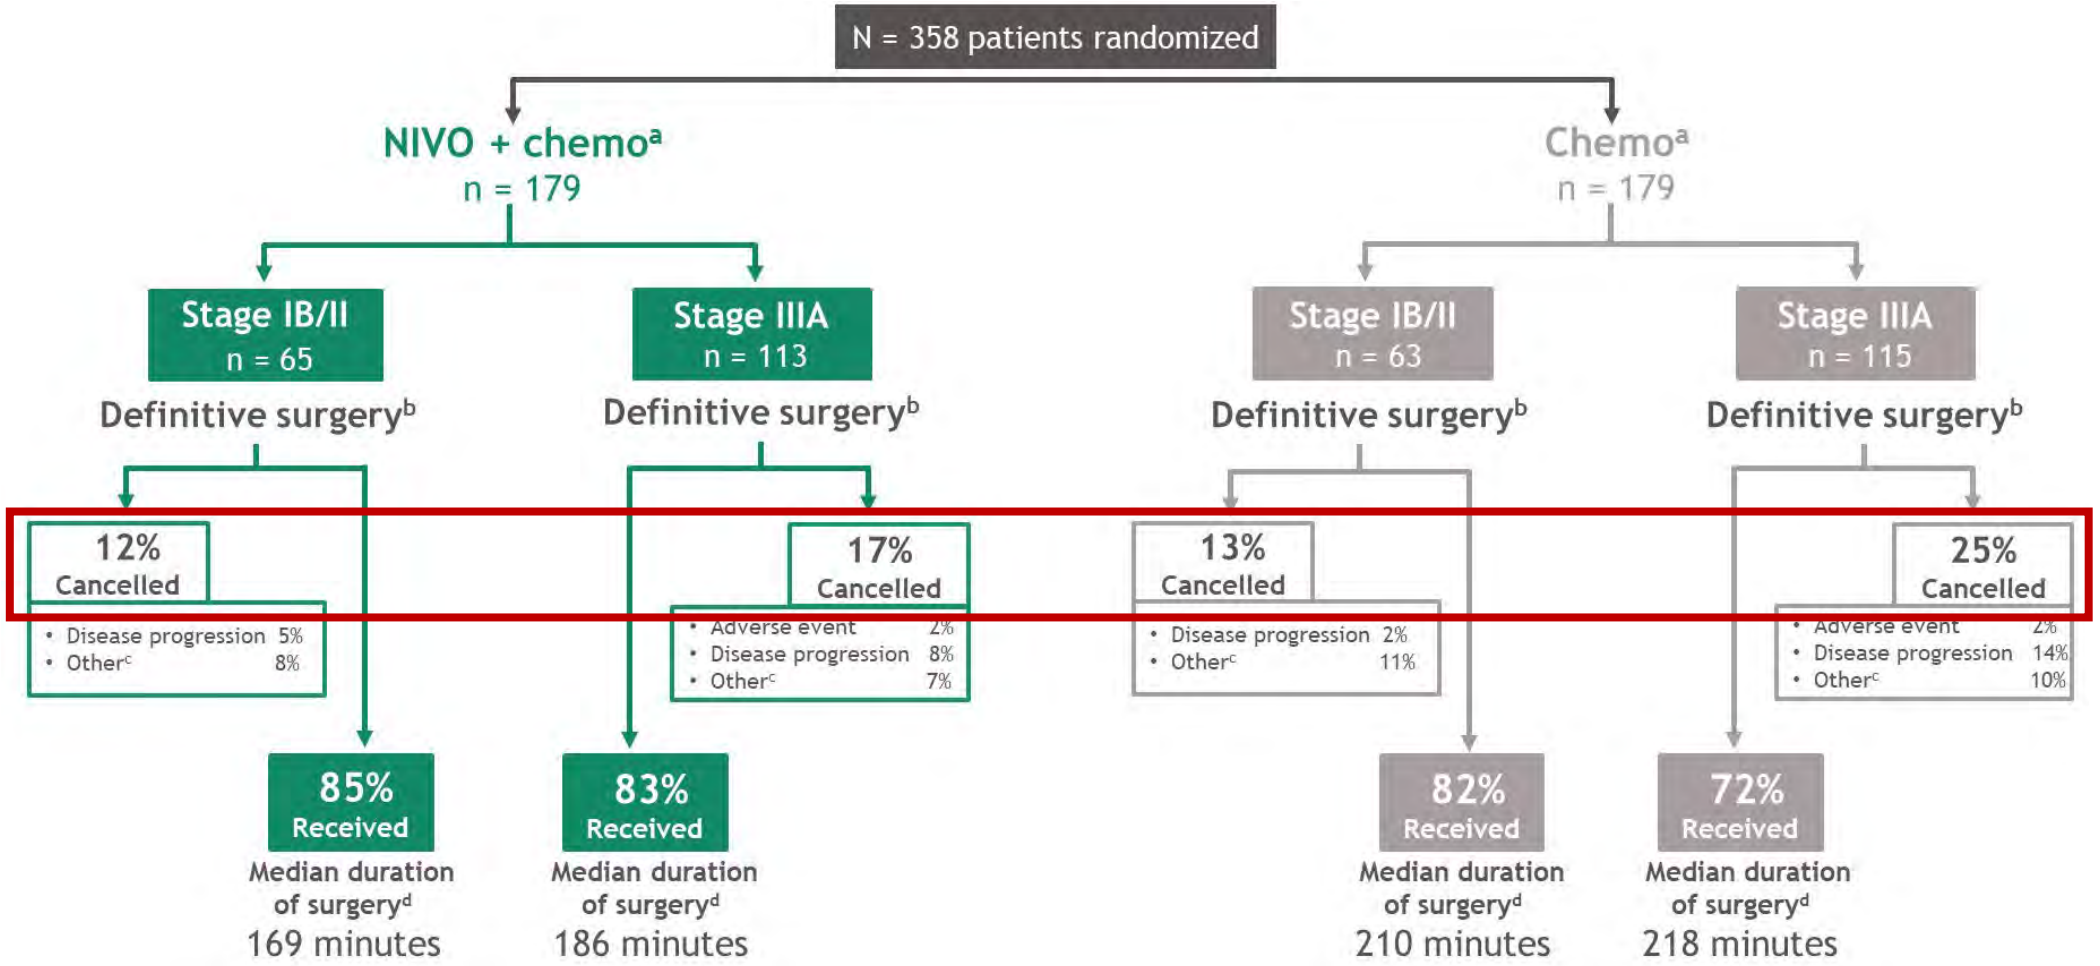
- MPR by BIPR
- OS
- Time to death or distant metastases

Key exploratory endpoints included

- ORR by BICR
- **Feasibility of surgery; peri- and post-operative surgery-related AEs**

Spicer J, et al. ASCO 2021. Abstract 8503.

Neoadjuvant: CheckMate 816



Spicer J, et al. ASCO 2021. Abstract 8503.

Conclusions

- Systemic benefit of neoadjuvant or adjuvant chemotherapy is similar
- Rate of missed surgery is high with chemoimmunotherapy
- Response does not impact the type of surgery
- Surgery is the curative step!

What would be your treatment approach for this patient?

- Neoadjuvant therapy
- Adjuvant therapy

Staging of Non-small Cell Lung Cancer

16% of patients		22% of patients	57% of patients
Stage I	**Stage II**	**Stage III**	**Stage IV**
			Primary tumor	**Lymph node metastasis**	**Lymph node metastases**	**Metastatic tumor**
Cancer is 3–5 cm in the lung and has not spread.	Cancer is 3–5 cm with localized lymph node metastases or is 5–7 cm.	Cancer may have spread to the sternum, lung lining, heart, or major blood vessels.	Cancer may also have spread to distant lymph nodes, the other lung, or to other organs.

Which option at relapse?

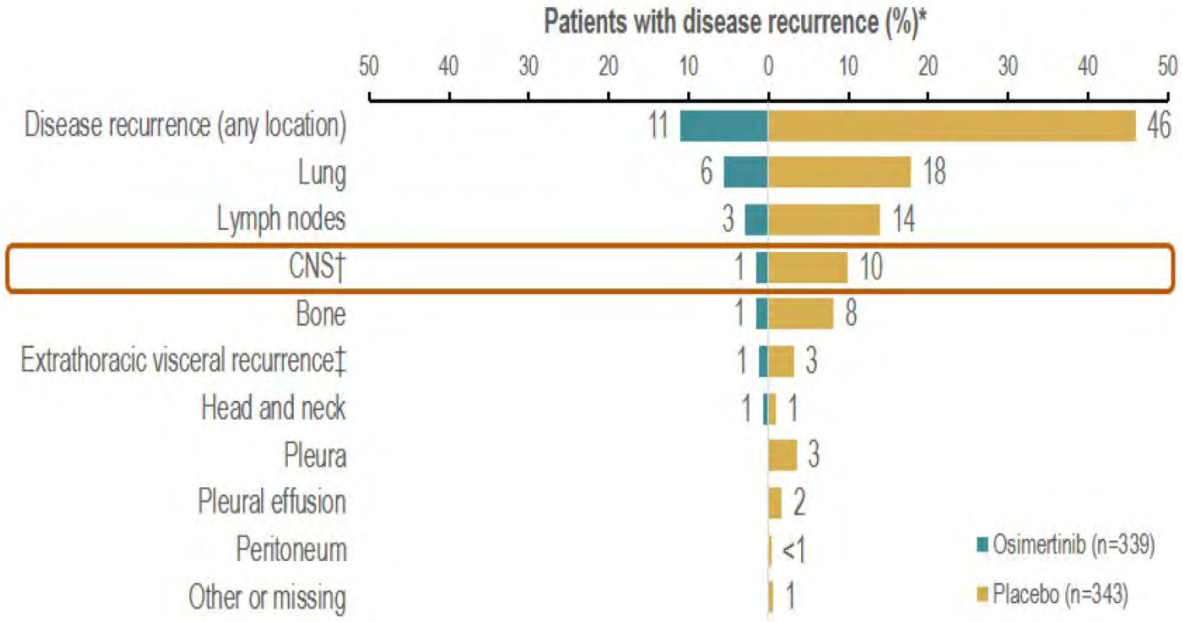
Site of Relapse in Early or Locally Advanced NSCLC

ADAURA

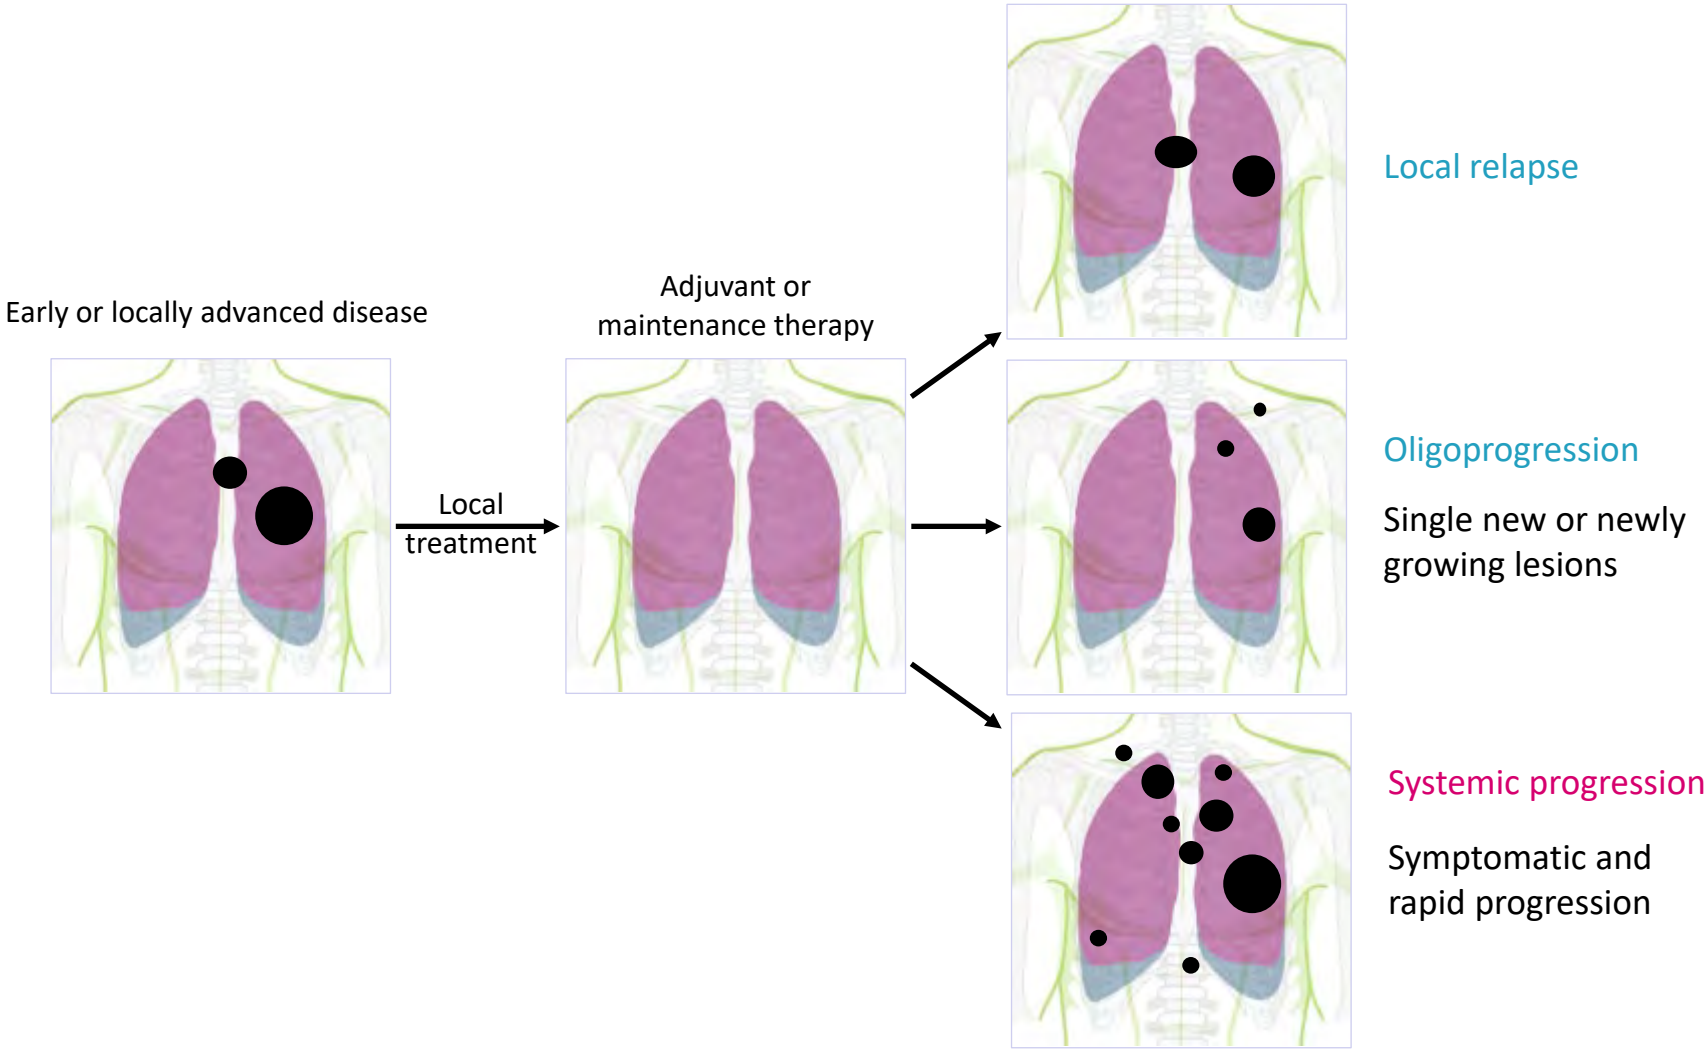


PACIFIC

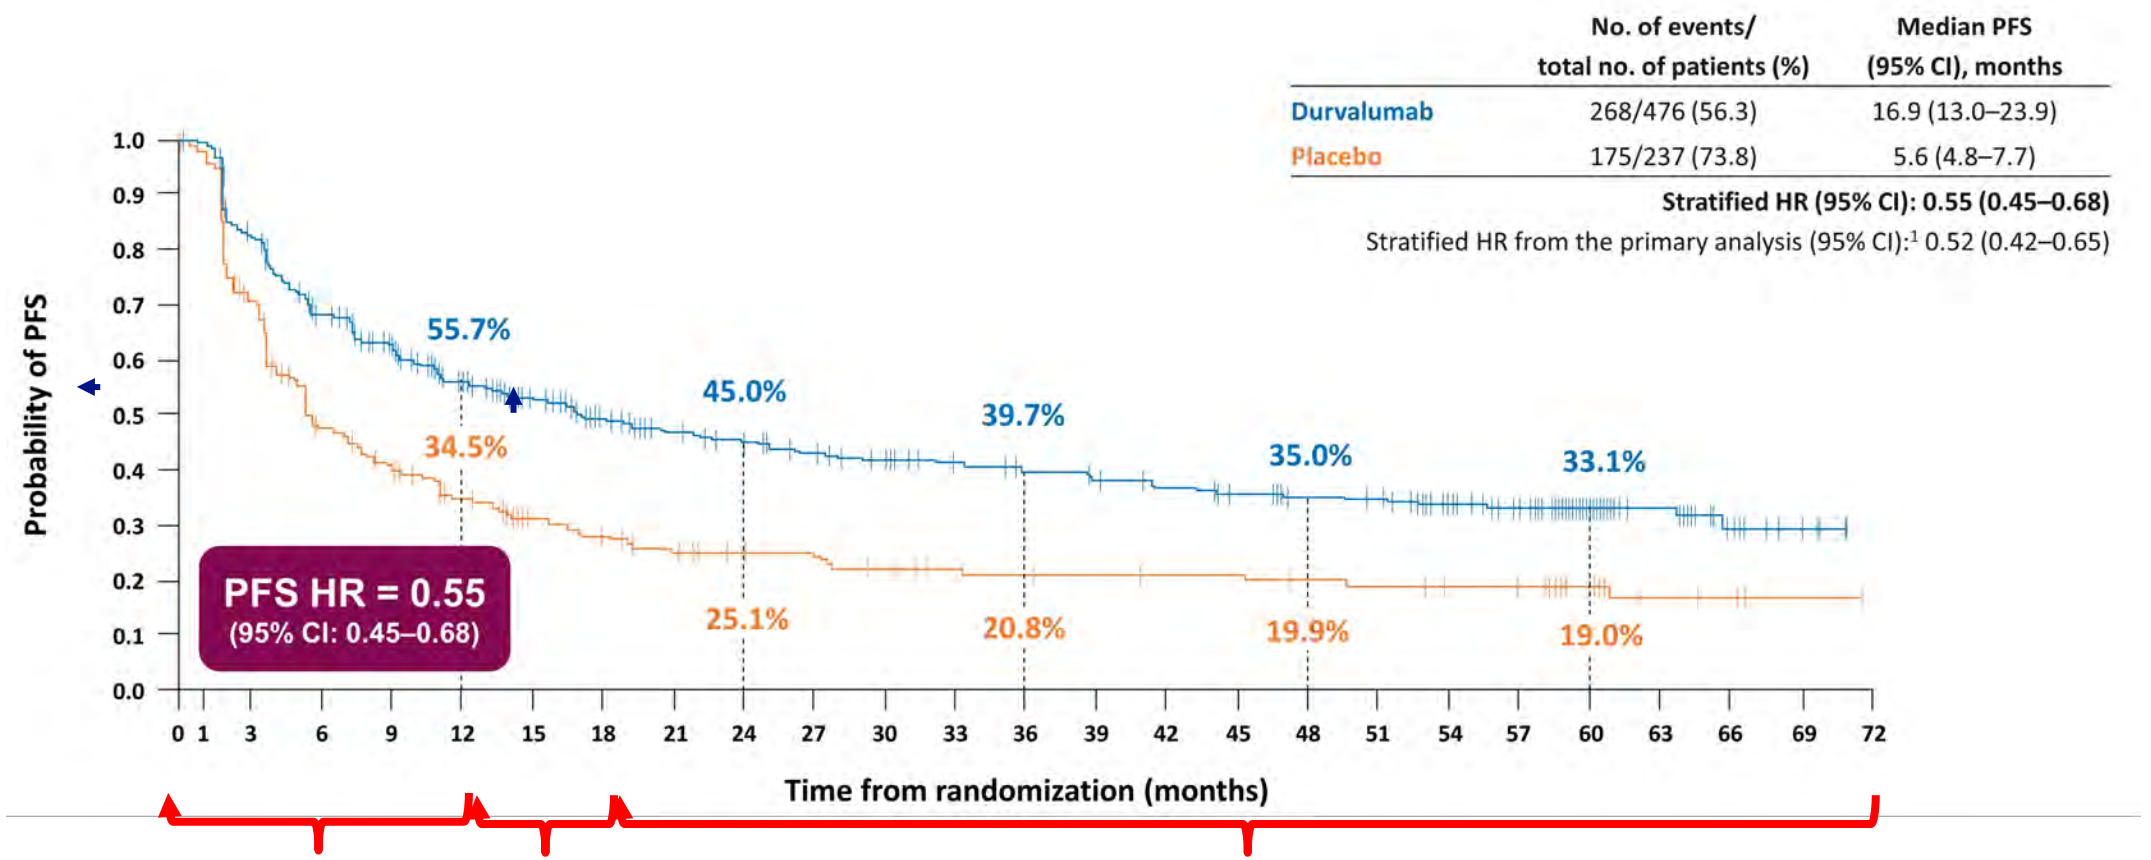
Updated Incidence of New Lesions by BICR* (ITT)

New Lesion Site†	Durvalumab (N=476)	Placebo (N=237)
Patients with any new lesion, n (%)	107 (22.5)	80 (33.8)
Lung	60 (12.6)	44 (18.6)
Lymph nodes	31 (6.5)	27 (11.4)
Brain	30 (6.3)	28 (11.8)
Liver	9 (1.9)	8 (3.4)
Bone	8 (1.7)	7 (3.0)
Adrenal	3 (0.6)	5 (2.1)
Other	10 (2.1)	5 (2.1)

Factors Influencing Therapy Decision:
1. Type of Relapse



Factors Influencing Therapy Decision:
2. Timing of Relapse – PACIFIC as an Example



Early recurrence

During therapy or at therapy stop

Late recurrence

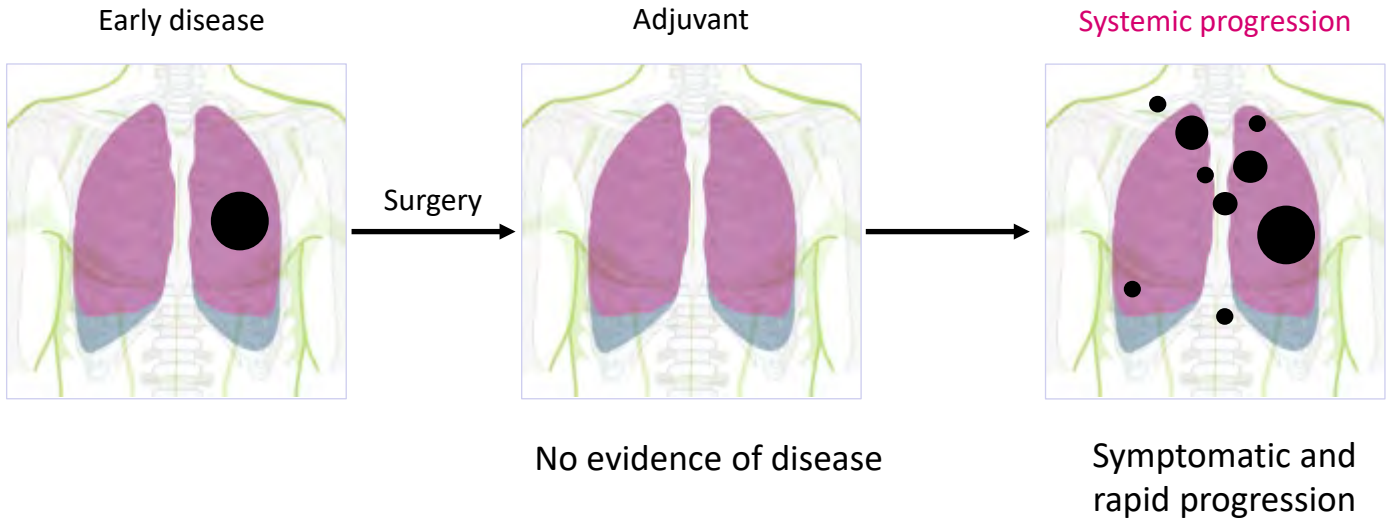
Other Factors Influencing Treatment Decision

1. Potential efficacy of therapies for advanced disease
2. Toxicity of previous therapy
3. Patient characteristics (eg, age, PS, comorbidities)
4. Biologic characteristics (presence of a specific driver, PD-L1)

Potential Clinical Scenarios: Simulated Situations

1. Patient with systemic progression during adjuvant immunotherapy
2. Patient with local relapse after the end of adjuvant immunotherapy
3. Patient with oligoprogression during adjuvant immunotherapy

Case 1: Patient With Systemic Progression During Adjuvant Immunotherapy



Question: What Is the Best Option?

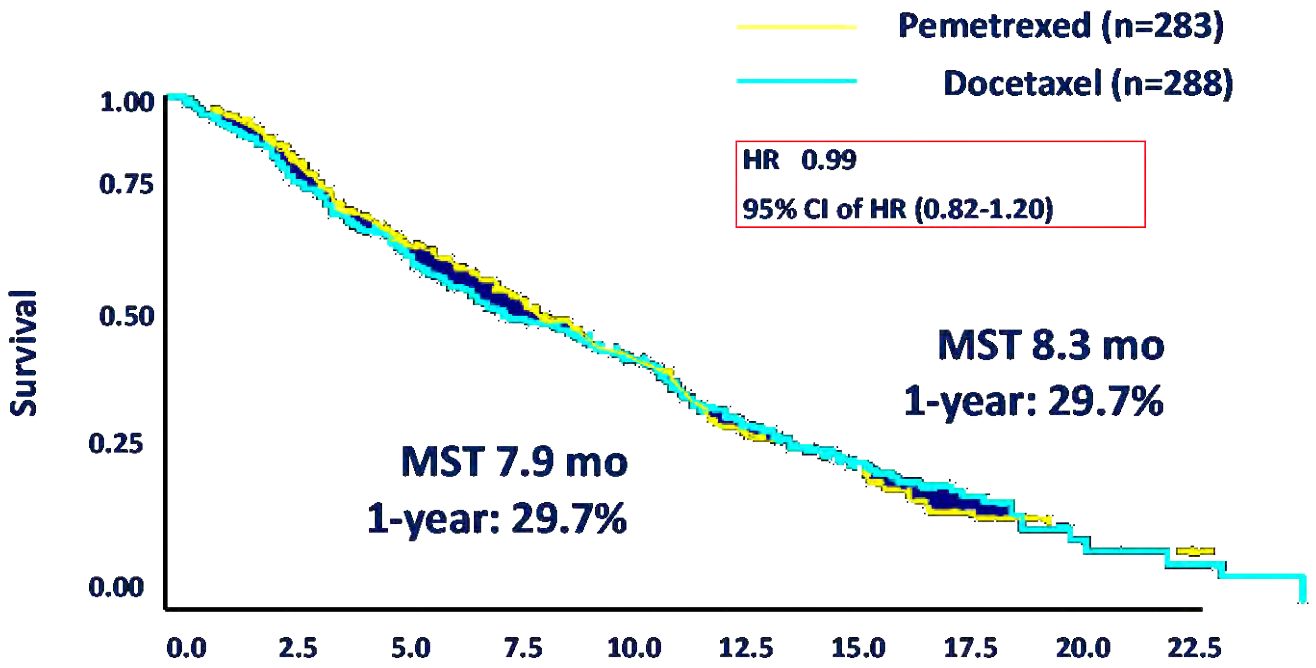
- Standard second-line therapy (ie, docetaxel single agent or in combo with antiangiogenesis agent)
- Platinum-based chemotherapy
- Immunotherapy-based combination
- Targeted therapy

Case 1: Patient With Systemic Progression During Adjuvant Immunotherapy

Efficacy of second-line therapy is modest

Docetaxel, pemetrexed, or docetaxel + nintedanib as potential options

Median PFS: 3–4 months
Median OS: 7–8 months



Toxicity particularly with docetaxel is a clinical issue

Hanna N, et al. *J Clin Oncol*. 2004;22:1589-1597.

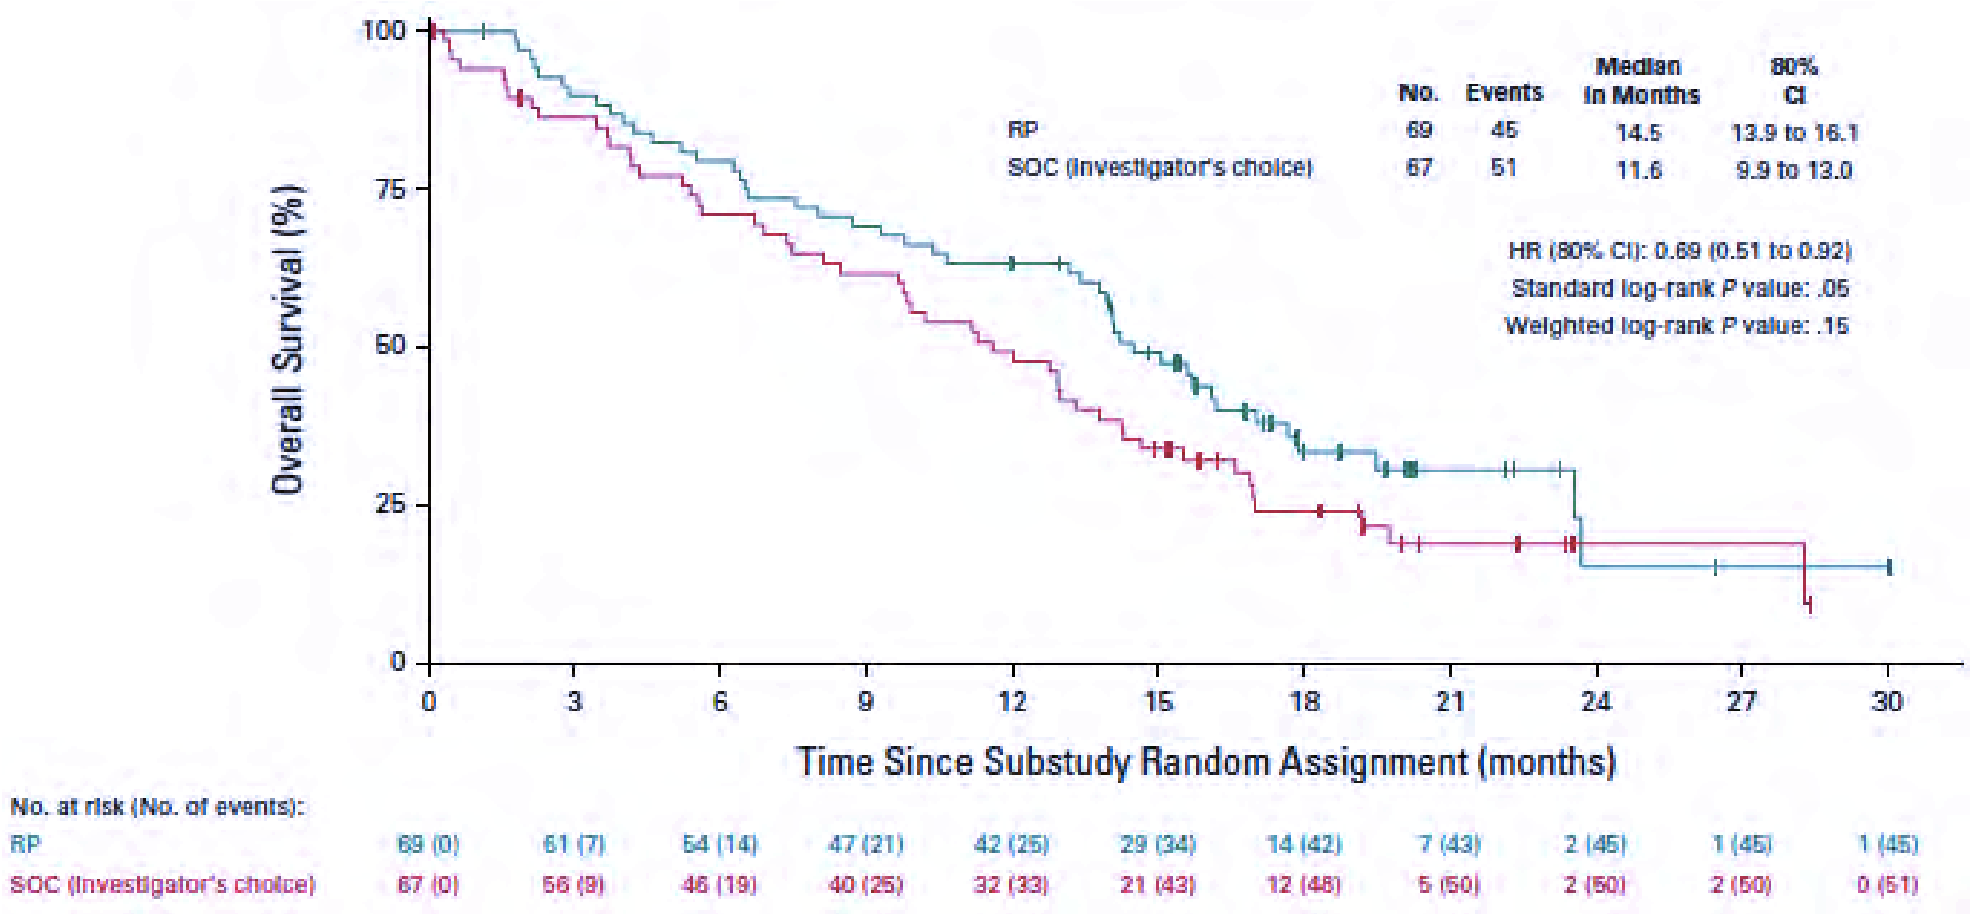
Sotorasib Is an Option in *KRAS*$^{G12C+}$: PFS in CodeBreaK 200

	Sotorasib 960 mg oral daily (N = 171)	Docetaxel 75 mg/m² IV Q3W (N = 174)
HR (95% CI)†	0.66 (0.51, 0.86)	
P-value (1-sided)‡	*P* = 0.002	
Median PFS, months (95% CI)§	5.6 (4.3, 7.8)	4.5 (3.0, 5.7)

CodeBreaK 200 met its primary endpoint with sotorasib demonstrating superior PFS over docetaxel (HR 0.66, *P* = 0.002); 12-month PFS rate was 24.8% for sotorasib and 10.1% for docetaxel

Johnson M, et al. ESMO 2022. Abstract LBA10.

Immunotherapy Rechallenge: OS With Pembro-Ramucirumab in Lung-MAP Trial



Reckamp KL, et al. *J Clin Oncol*. 2022;40:2295-2306.

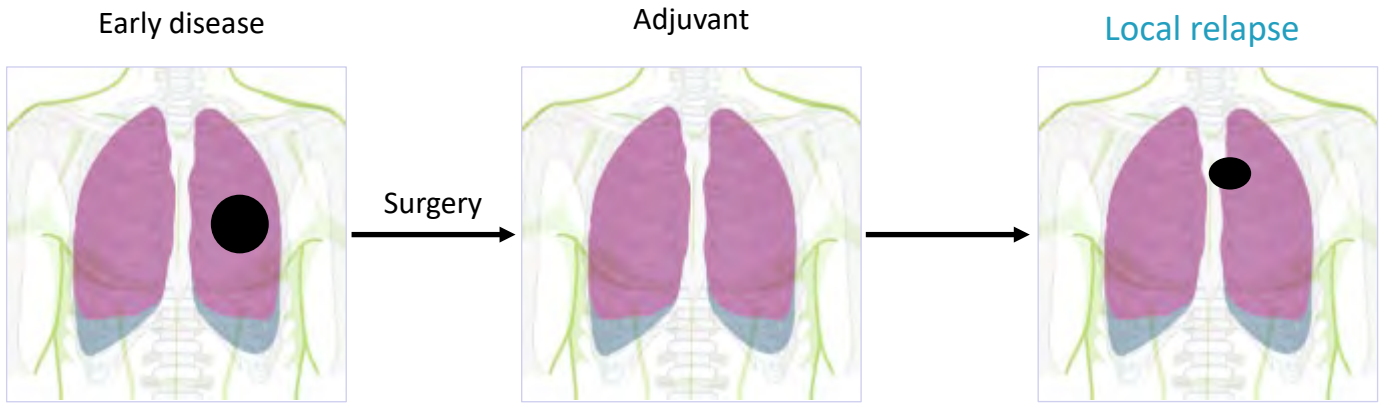
Platinum Rechallenge Is a Potential Option in NSCLC

Clinical trials in patients relapsing after at least 3 months after platinum-based chemotherapy

First author, year [ref.]	Phase	Patients	Arms	PFS months	p-value	OS months	p-value	Response rate %	p-value
Pallis, 2010 [23]	III	132	Docetaxel + carboplatin	3.33	0.012	10.3	0.55	10.4	0.764
			Docetaxel	2.60		7.70		7.7	
Takeda, 2009 [22]	III	130	Docetaxel + gemcitabine	2.8	0.028	10.3	0.36	7.0	0.71
			Docetaxel	2.1		10.1		6.8	
Gebbia, 2009 [5]	III	84	Docetaxel	12.4 weeks	0.44	40 weeks	0.18	6.4	NR
			Docetaxel + vinorelbine or gemcitabine	13.1 weeks	0.60	32.6 weeks	0.90	16.7	
			Docetaxel + capecitabine	11.9 weeks		39.7 weeks		5.3	
Ardizzoni, 2012 [25]	II	479	Pemetrexed + carboplatin	3.9	0.70	8.7	0.316	15	0.062
			Pemetrexed	3.0		8.2		9	
Smit, 2009 [24]	II	240	Pemetrexed + carboplatin	4.2	0.005	8.0	NS	9	NS
			Pemetrexed	2.8		7.6		4	
Pectasides, 2005 [26]	II	130	Docetaxel + irinotecan	5.6	0.065	6.5	0.49	20	0.36
			Docetaxel	4.8		6.4		14	
Wachters, 2005 [27]	II	108	Docetaxel + irinotecan	15 weeks	0.42	27 weeks	0.69	10	NR
			Docetaxel	18 weeks		32 weeks		16	
Georgoulias, 2005 [30]	II	147	Cisplatin + irinotecan	NR	NR	7.8	0.934	22.5	0.012
			Cisplatin			8.8		7	

Platinum rechallenge seems to offer higher ORR and longer PFS than single-agent CT

Case 2: Patient With Local Relapse After the End of Adjuvant Immunotherapy



NCCN guidelines

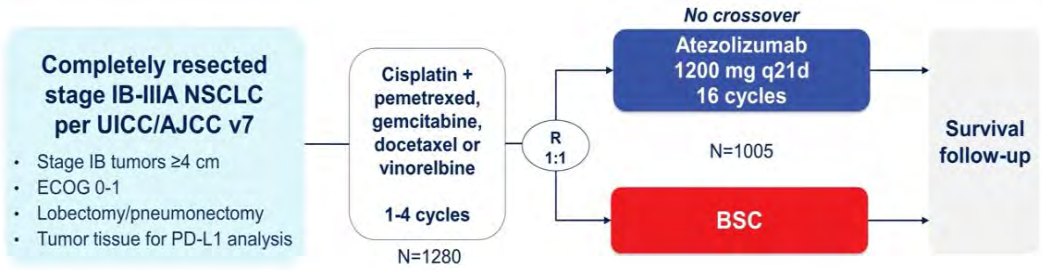
Resectable recurrence: Surgery preferred

Nonresectable recurrence: Chemoradiotherapy preferred

Case 2: Patient With Local Relapse After the End of Adjuvant Immunotherapy

Should we consider a rechallenge with immunotherapy?

IMpower010: Atezolizumab for 1 year



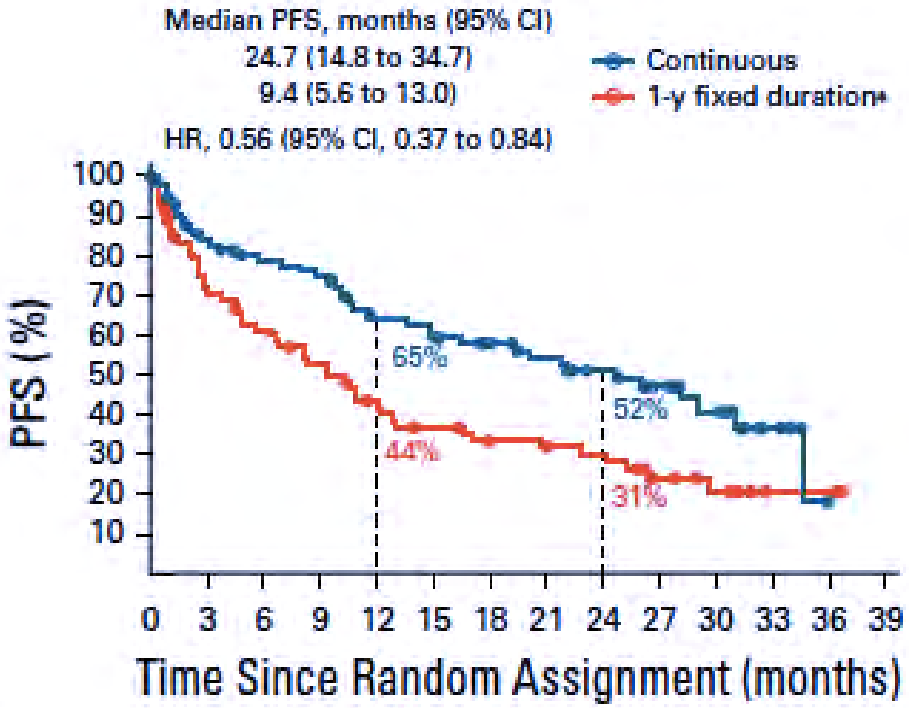
Stratification factors
- Male/female
- Stage (IB vs II vs IIIA)
- Histology
- PD-L1 tumor expression status[a]: TC2/3 and any IC vs TC0/1 and IC2/3 vs TC0/1 and IC0/1

Primary endpoints
- Investigator-assessed DFS tested hierarchically:
  - PD-L1 TC ≥1% (per SP263) stage II-IIIA population
  - All-randomized stage II-IIIA population
  - ITT population (stage IB-IIIA)

Key secondary endpoints
- OS in ITT population
- DFS in PD-L1 TC ≥50% (per SP263) stage II-IIIA population
- 3-y and 5-y DFS in all 3 populations

Felip E et al ELCC 2022

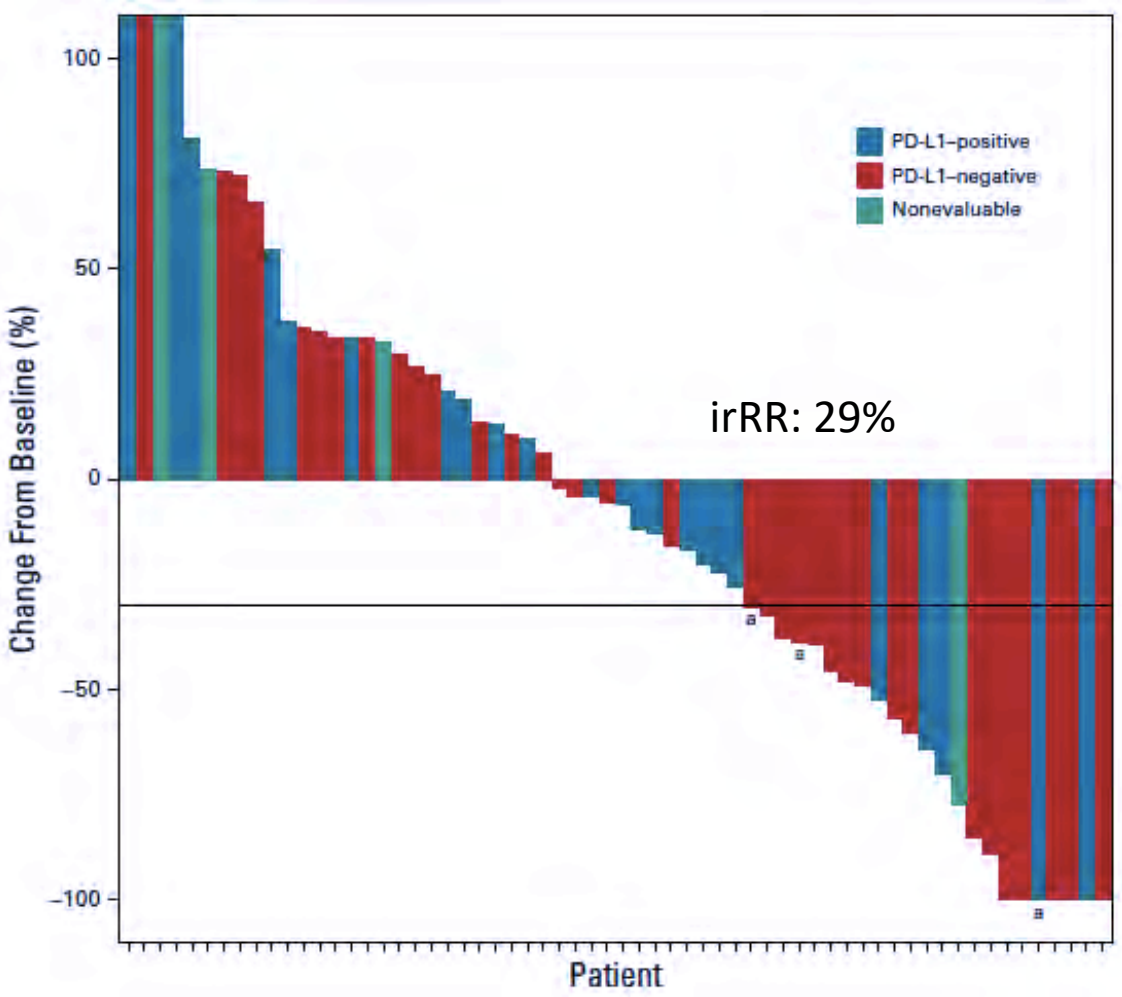
CheckMate 153: Nivolumab continuous vs 1-yr duration

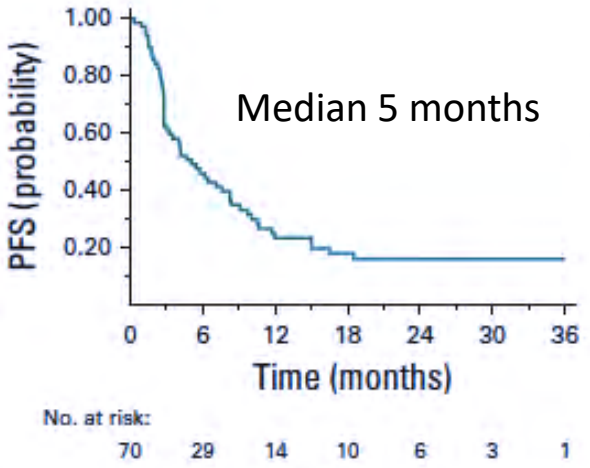


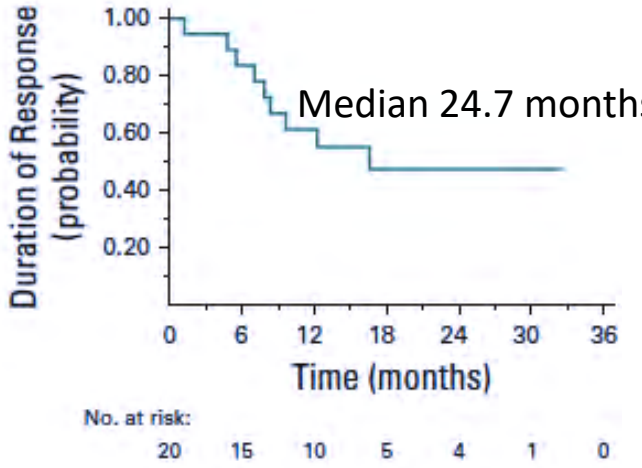
Immunotherapy optimal duration is a relevant issue

Waterhouse DM, et al. *J Clin Oncol*. 2020;38:3863-3873.

IO + IO Combo Could Be Effective in IO-Pretreated Patients: Data With Pembrolizumab + Ipilimumab in Melanoma



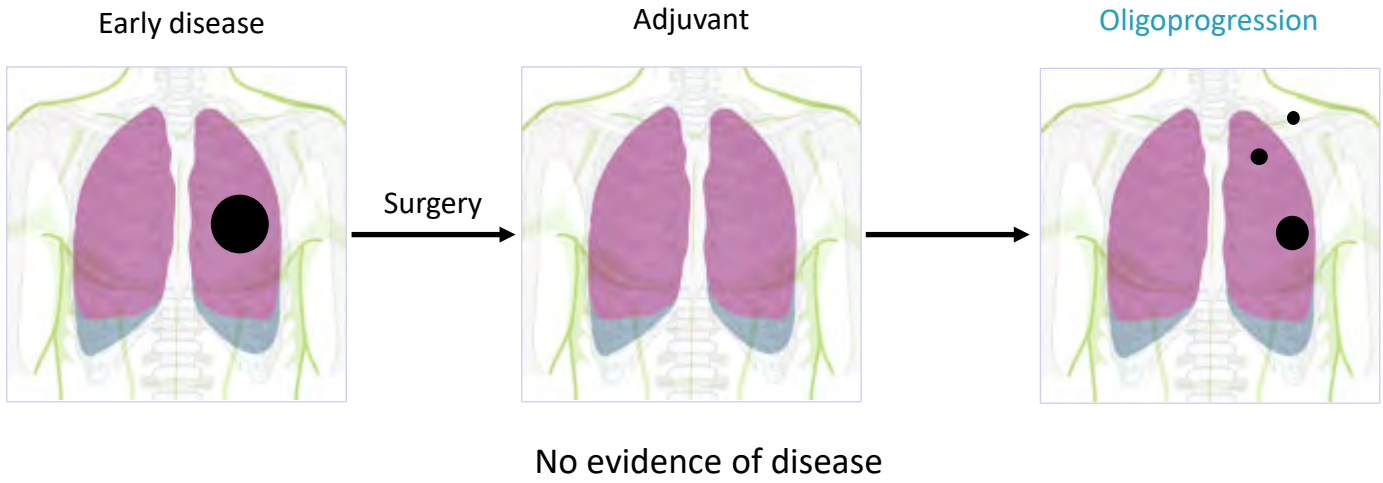




Median DOR: 16.6 months

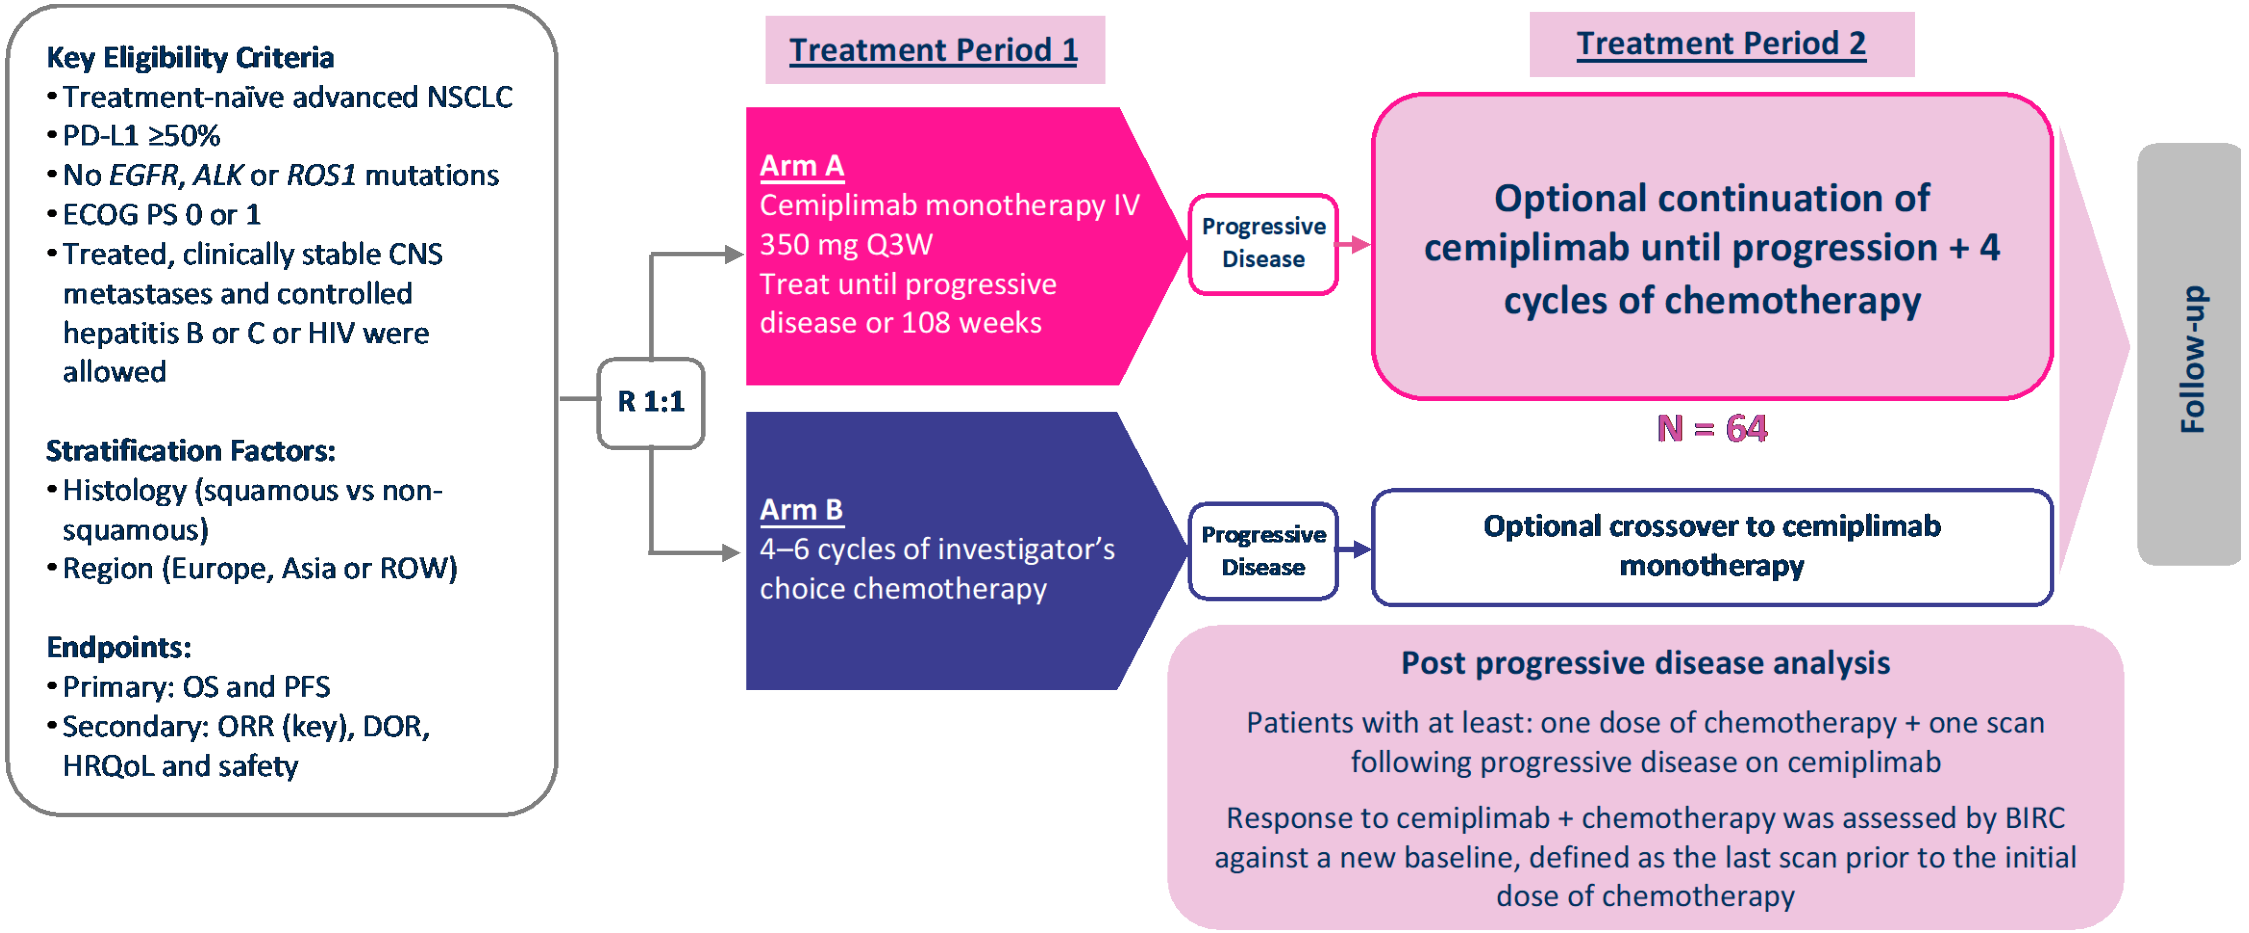
Olson DJ, et al. *J Clin Oncol*. 2021;39:2647-2655.

Case 3: Patient With Oligoprogression During Adjuvant Immunotherapy



Local therapy recommended
Question: Should we continue immunotherapy beyond progression?

Immunotherapy Beyond Progression: Data With Cemiplimab in EMPOWER-Lung 1 Trial



Özgüroğlu M, et al. ESMO 2022. Abstract 112P.

Prolonged Survival in the Second-Line Setting With Cemiplimab Beyond Progression

	Cemiplimab Beyond Progression N=64	
OS	**Period 1+2 Randomization to Death**	**Period 2 Day 1 of Continued Treatment to Death**
Median (95% CI, months)	27.4 (23.0, 31.8)*	15.1 (11.3, 18.7)
Estimated Survival Probability, % (95% CI)		
6 months	100 (NE, NE)	91.9 (81.6, 96.5)
12 months	91.8 (81.4, 96.5)	56.8 (43.0, 68.5)
24 months	60.5 (46.6, 71.8)	26.2 (14.3, 39.8)
36 months	32.3 (20.1, 45.1)	NE (NE, NE)

*Includes the 15.1 months of survival beyond progression; CI, confidence interval; OS, overall survival; NE, non-evaluable.

Data cut-off date: March 4

Continued cemiplimab with addition of chemotherapy beyond progression appears superior to historical data for chemotherapy in the 2nd line setting where median OS is 8.4 months (range: 5.6 - 11.2) (Bersanelli et al., Lung Cancer, 2020)

Özgüroğlu M, et al. ESMO 2022. Abstract 112P.

Conclusions

- Relapse in patients exposed to immunotherapy for early-stage disease treated with curative intent is a relevant unmet need
- Several factors influence therapy decision
  - Type of relapse
  - Timing
  - Patient characteristics
- Few data are currently available with rechallenge or continuation of immunotherapy beyond progression as a potential option
- Clinical trials are urgently needed

> Please complete the **evaluation link** that will be sent to you via chat

Repeat Question 3

In the EMPOWER-Lung 1 trial, cemiplimab showed improvement over chemotherapy in:

1. PFS only
2. OS only
3. PFS and OS
4. Neither

Repeat Question 4

70-year-old female, former smoker (25 pk/yrs) presents with stage IIIB NSCLC with LSCN involvement. Cell type is squamous cell carcinoma. PD-L1 level is 60%. Patient completes chemo-XRT with 60 Gy and concurrent weekly paclitaxel/carboplatin with excellent PR on f/u CT imaging, no complications. Which of the following is “approve”’ consolidation therapy in this setting?

1. Durvalumab
2. Pembrolizumab
3. Atezolizumab
4. Nivolumab

Day 2: Plenary Sessions

Monday, 14 November 2022 from 16.00 – 19.15 CET

Time	Title	Speaker
16.00 – 16.10 (10 min)	**Session Open** • ARS questions	Corey Langer
16.10 – 16.30 (20 min)	**Optimizing First-Line Therapy in NSCLC – Integration of Immunotherapy Into Frontline Regimens** • Optimal use of immunotherapeutic treatment choices in frontline NSCLC	Luis Paz-Ares
16.30 – 16.50 (20 min)	**Current Immunotherapy Options for Relapsed NSCLC** • Optimal use of immunotherapeutic treatment choices in relapsed NSCLC including considerations for potential rechallenge, and treatment selection mono vs combination therapy	Benjamin Besse
16.50 – 17.25 (35 min)	**Tumor Board Discussion** • Case 1 (10 min) • Case 2 (10 min) • Discussion & Q&A (15 min)	Moderator: Solange Peters Francesca Fusco Luis Angel Leon Mateos All faculty
17.25 – 17.35 (10 min)	***Break***	
17.35 – 17.50 (15 min)	**ALK Inhibitors in NSCLC** • Considerations for optimal use in clinical practice in patients with and without brain metastasis	Enriqueta Felip
17.50 – 18.05 (15 min)	**EGFR Inhibitors in NSCLC** • Considerations for optimal use in clinical practice	Johan Vansteenkiste
18.05 – 18.30 (25 min)	**Other Targets in NSCLC** • Considerations for optimal use of ROS1, NTRK, RET and MET inhibitors in clinical practice	Anne-Marie Dingemans
18.30 – 19.05 (35 min)	**Tumor Board Discussion** • Case 1 (10 min) • Case 2 (10 min) • Discussion & Q&A (30 min)	Moderator: Corey Langer May-Lucie Meyer Xander Verbeke All faculty
