Global Lung Cancer Academy

Welcome and Meeting Overview

Corey Langer, MD

Meet the faculty

CO-CHAIRS

Corey J. Langer, MD, FACP
University of Pennsylvania, PA, USA

Carlos H. Barrios, MD
Center at Hospital São Lucas, Pontifícia Universidade Católica do Rio Grande do Sul (PUCRS), Porto Alegre, Brazil

FACULTY

Narjust Florez (Duma), MD
Dana-Farber Cancer Institute/ Harvard Cancer Center, MA, USA

Barbara Melosky, MD, FRCP
University of British Columbia, Vancouver, Canada

Edgardo S. Santos, MD
Charles E. Schmidt College of Medicine, Florida Atlantic University, FL, USA

Anne S. Tsao, MD
MD Anderson Cancer Center, Houston, TX, USA

William N. William, MD
Beneficência Portuguesa de São Paulo, Brazil

Ignacio I. Wistuba, MD
MD Anderson Cancer Center, Houston, TX, USA

Global Lung Cancer Academy

Objectives of the program

- Discuss current evidence-based practices in the diagnosis and treatment of lung cancer
- Learn about current genomic testing practices and how these results inform treatment decisions
- Understand advances made in immunotherapy for lung cancer and how these agents are being used in clinical practice
- Gain insights into the latest developments in targeted therapies used for lung cancer
- Promote best practice cancer care via the review of clinical patient cases
- Recognize the major clinical trials underway to further develop treatment in lung cancer
- Learn about the regional challenges and differences in lung cancer treatment patterns in Latin America and Canada

Day 1: Plenary Sessions

Friday, 21 October 2022 from 4.00 PM – 8.00 PM EDT

Time (EDT)	Title	Speaker
4.00 PM – 4.10 PM (10 min)	**Welcome and Meeting Overview** • Introduction to audience response system (ARS)	Corey Langer
4.10 PM – 4.40 PM (30 min)	**Recent Developments in NSCLC – What Is New in Research and Management?** • Overview of recently presented data in NSCLC	Corey Langer
4.40 PM – 5.00 PM (20 min)	**Biomarker and Mutational Testing for NSCLC – What, Where, and When?** • NSCLC heterogeneity, overview of current and emerging biomarkers and co-mutations, and best practices and guidelines for testing at diagnosis and during treatment of NSCLC	Ignacio Wistuba
5.00 PM – 5.20 PM (20 min)	**Neoadjuvant Therapy for NSCLC – Is It Ready for Prime Time?** • Current state of neoadjuvant therapy in resectable NSCLC	Anne Tsao
5.20 PM – 5.50 PM (30 min)	**Debate: Adjuvant or Neoadjuvant Therapy for NSCLC?** • Neoadjuvant therapy (10 min) • Adjuvant therapy (10 min) • Discussion and voting (10 min)	Moderator: Corey Langer Anne Tsao Narjust Florez All faculty
5.50 PM – 6.00 PM (10 min)	***Break***	
6.00 PM – 6.20 PM (20 min)	**Locally Advanced Unresectable NSCLC – What Are the Options?** • Current standard practices and ongoing studies	Edgardo S. Santos
6.20 PM – 6.40 PM (20 min)	**Targeted Therapies for Advanced NSCLC** • Summary of targeted therapies for different NSCLC genotypes	Barbara Melosky
6.40 PM – 7.00 PM (20 min)	**Immunotherapy Approaches for Advanced NSCLC** • Predictive biomarkers, monotherapy vs combination strategies, mechanisms of resistance, and rechallenge	Edgardo S. Santos
7.00 PM – 7.20 PM (20 min)	**De Novo—or at Relapse—Oligometastatic NSCLC: Management of Local and Systemic Disease** • Work-up of first recurrence vs de novo oligometastatic NSCLC, including sites of involvement (isolated vs systemic recurrence)	Narjust Florez
7.20 PM – 7.50 PM (30 min)	**Tumor Board Discussion** • Patient case 1 (10 min) • Patient case 2 (10 min) • Discussion and Q&A (10 min)	Moderator: Corey Langer Vinícius Lorandi Barbara Melosky All faculty
7.50 PM – 8.00 PM (10 min)	**Session Close** • ARS questions	Corey Langer

Day 2: Plenary Sessions

Monday, 24 October 2022 from 4.00 PM – 7.00 PM EDT

Time (EDT)	Title	Speaker
4.00 PM – 4.10 PM (10 min)	**Session Open** • ARS questions	Corey Langer and Carlos Barrios
4.10 PM – 4.40 PM (30 min)	**Interactive Discussion: Regional Challenges in NSCLC Management** • Interactive discussion and Q&A (15 min)	Moderator: Carlos Barrios All faculty
4.40 PM – 5.00 PM (20 min)	**Current Diagnostic Options and Initial Management of Early-Stage NSCLC in Latin America** • Overview of currently available diagnostic methods and treatment options for early-stage NSCLC (resectable vs unresectable)	William William
5.00 PM – 5.20 PM (20 min)	**Current Treatment Options for Metastatic NSCLC in Latin America** • Overview of currently available treatment options for metastatic NSCLC	Carlos Barrios
5.20 PM – 5.50 PM (30 min)	**Tumor Board Discussion** • Patient case 1 (10 min) • Patient case 2 (10 min) • Discussion and Q&A (10 min)	Moderator: Carlos Barrios Caio Abner Leite Alvaro Guimaraes Paula All faculty
5.50 PM – 6.00 PM (10 min)	***Break***	
6.00 PM – 6.20 PM (20 min)	**Monitoring and Managing Immunotherapy-Related AEs** • Optimal monitoring and managing of the most common AEs associated with immunotherapy	Edgardo S. Santos
6.20 PM – 6.50 PM (30 min)	**Tumor Board Discussion** • Patient case (10 min) • Discussion and Q&A (20 min)	Moderator: Corey Langer Barbara Melosky All faculty
6.50 PM – 7.00 PM (10 min)	**Session Close** • ARS questions	Carlos Barrios

Global Lung Cancer Academy

Question 1

In which country do you currently practice?

1. Argentina
2. Brazil
3. Canada
4. Colombia
5. Chile
6. Mexico
7. Peru
8. Other country in LATAM
9. Other country outside LATAM

Question 2

How would you describe your specialty?

1. General oncologist
2. Lung oncologist
3. General internal medicine
4. Fellow
5. Other

Question 3

In what percentage of your patients with lung cancer have you used neoadjuvant therapy?

1. None
2. ≤25%
3. 26%–50%
4. 51%–75%
5. ≥76%

Question 4

In the EMPOWER-Lung 1 trial, cemiplimab showed improvement over chemotherapy in:

1. PFS only
2. OS only
3. PFS and OS
4. Neither

Question 5

In what percentage of your patients with lung cancer do you perform liquid biopsy?

1. None
2. ≤20%
3. 21%–50%
4. 51%–75%
5. ≥76%

October 2022

Disclosures: Past 10 Years

- **Institutional Grant/Research Support**
  - Pfizer, Lilly, Advantagene, Inovio, Celgene, Vertex, Ariad (Takeda), Merck, Stemcentrx, Genentech/Roche, AstraZeneca, Trizell, GSK, Guardant, Fujifilm
- **Scientific Advisor**
  - Bristol Myers Squibb, Lilly, Pfizer, Synta, Boehringer-Ingelheim, AstraZeneca, Novartis, Abbott, Genentech/Roche, Bayer/Onyx, Celgene, Clarient, Clovis, Guardant, Merck, Gilead
- **Data Safety Monitoring Committees**
  - Lilly, Amgen, Peregrine, Incyte, SWOG, Oncocyte, VALOR

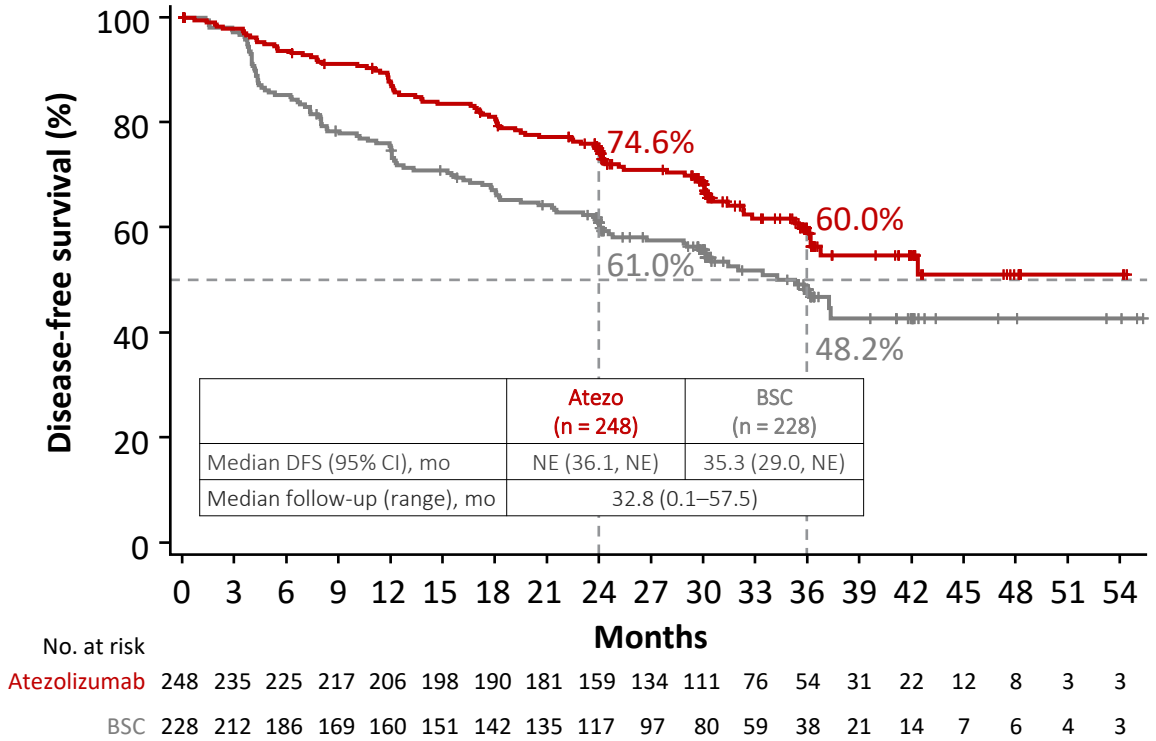
Curable NSCLC: Can We Isolate the Role of Immunotherapy in the Neoadjuvant and Combined Modality Arena?

Exporting CPIs to the Curative Setting

- IMpower010
- CheckMate 816
- NADIM
- PACIFIC

IMpower010: The Primary Endpoint of Improved DFS in Patients With PD-L1 TC ≥1%, Stage II–IIIA* NSCLC Was Met

DFS in PD-L1 TC ≥1%, Stage II–IIIA, Completely resected NSCLC



Primary Analysis Populations

Population analysed for DFS	n	HR (95% CI)§
PD-L1 TC ≥1%, stage II–IIIA	476	0.66 (0.50, 0.88)
All-randomized, stage II–IIIA	882	0.79 (0.64, 0.96)
ITT (all-randomized, stage IB–IIIA)	1005	0.81 (0.67, 0.99)

Endpoint was met at DFS IA

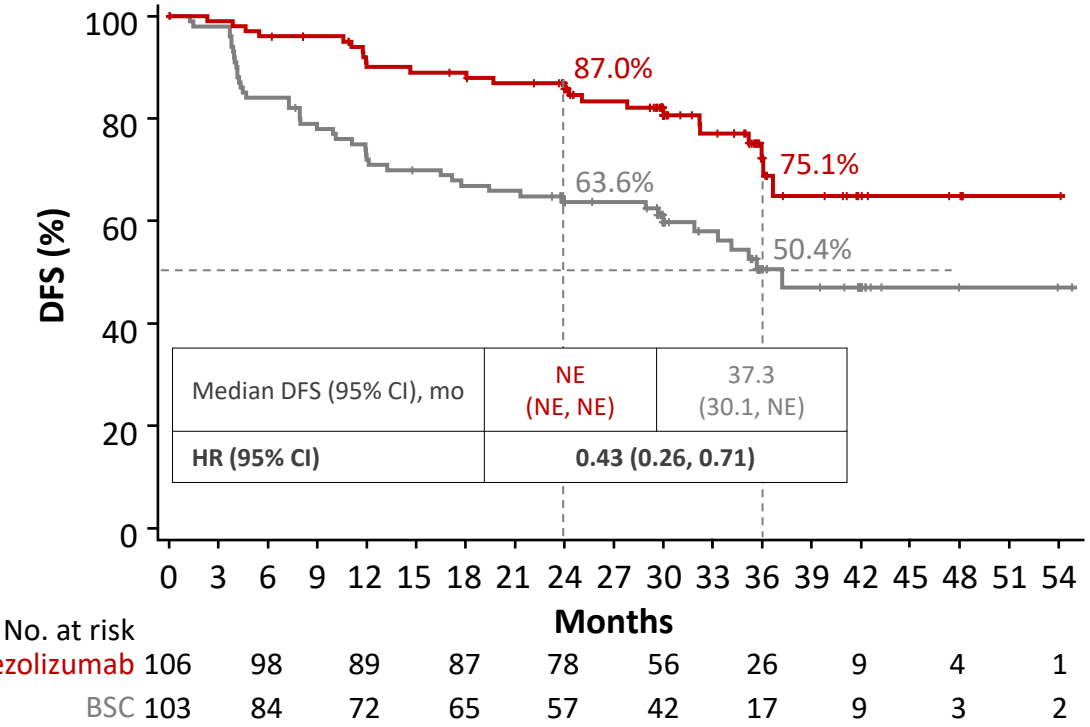
Endpoint was not met at DFS IA, and follow-up is ongoing

***Per *TNM* 7th Edition (select stage II–IIIB per *TNM* 8th Edition).**

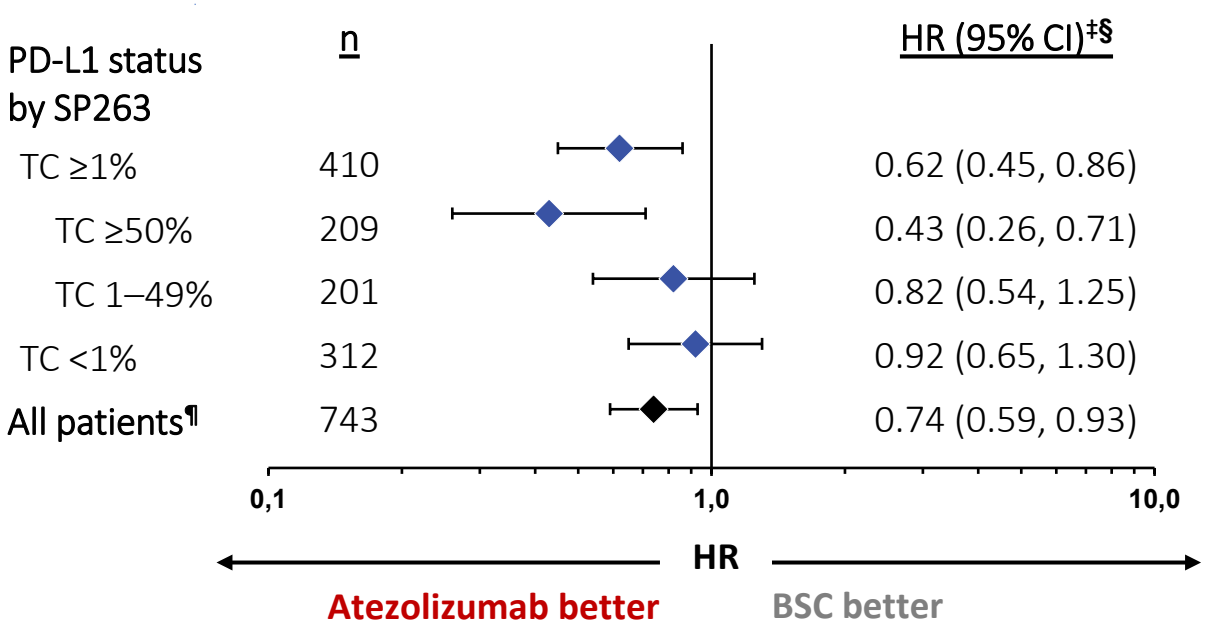
Wakelee H, et al. ASCO 2021. Abstract 8500; Felip E, et al. *Lancet.* 2021;398:1344-1357.

Greatest Magnitude of DFS Benefit With Adjuvant Atezolizumab Over BSC Was in PD-L1 TC ≥50%, Stage II–III NSCLC

DFS in PD-L1 TC ≥50%, Stage II–IIIA Population (excluding *EGFR*+/*ALK*+ NSCLC)[1]



DFS by PD-L1 Status in the All-Randomized, Stage II–IIIA Population (excluding *EGFR*+/*ALK*+ NSCLC)[2]



Clinical cut-off: 21 January 2021.

*Unstratified HR; ‡Stratified for all patients and PD-L1 TC ≥1%; unstratified for all other subgroups; §DFS analyses in the PD-L1 TC <1% and TC 1–49% subgroups were exploratory; ¶23 patients had unknown PD-L1 status as assessed by SP263.

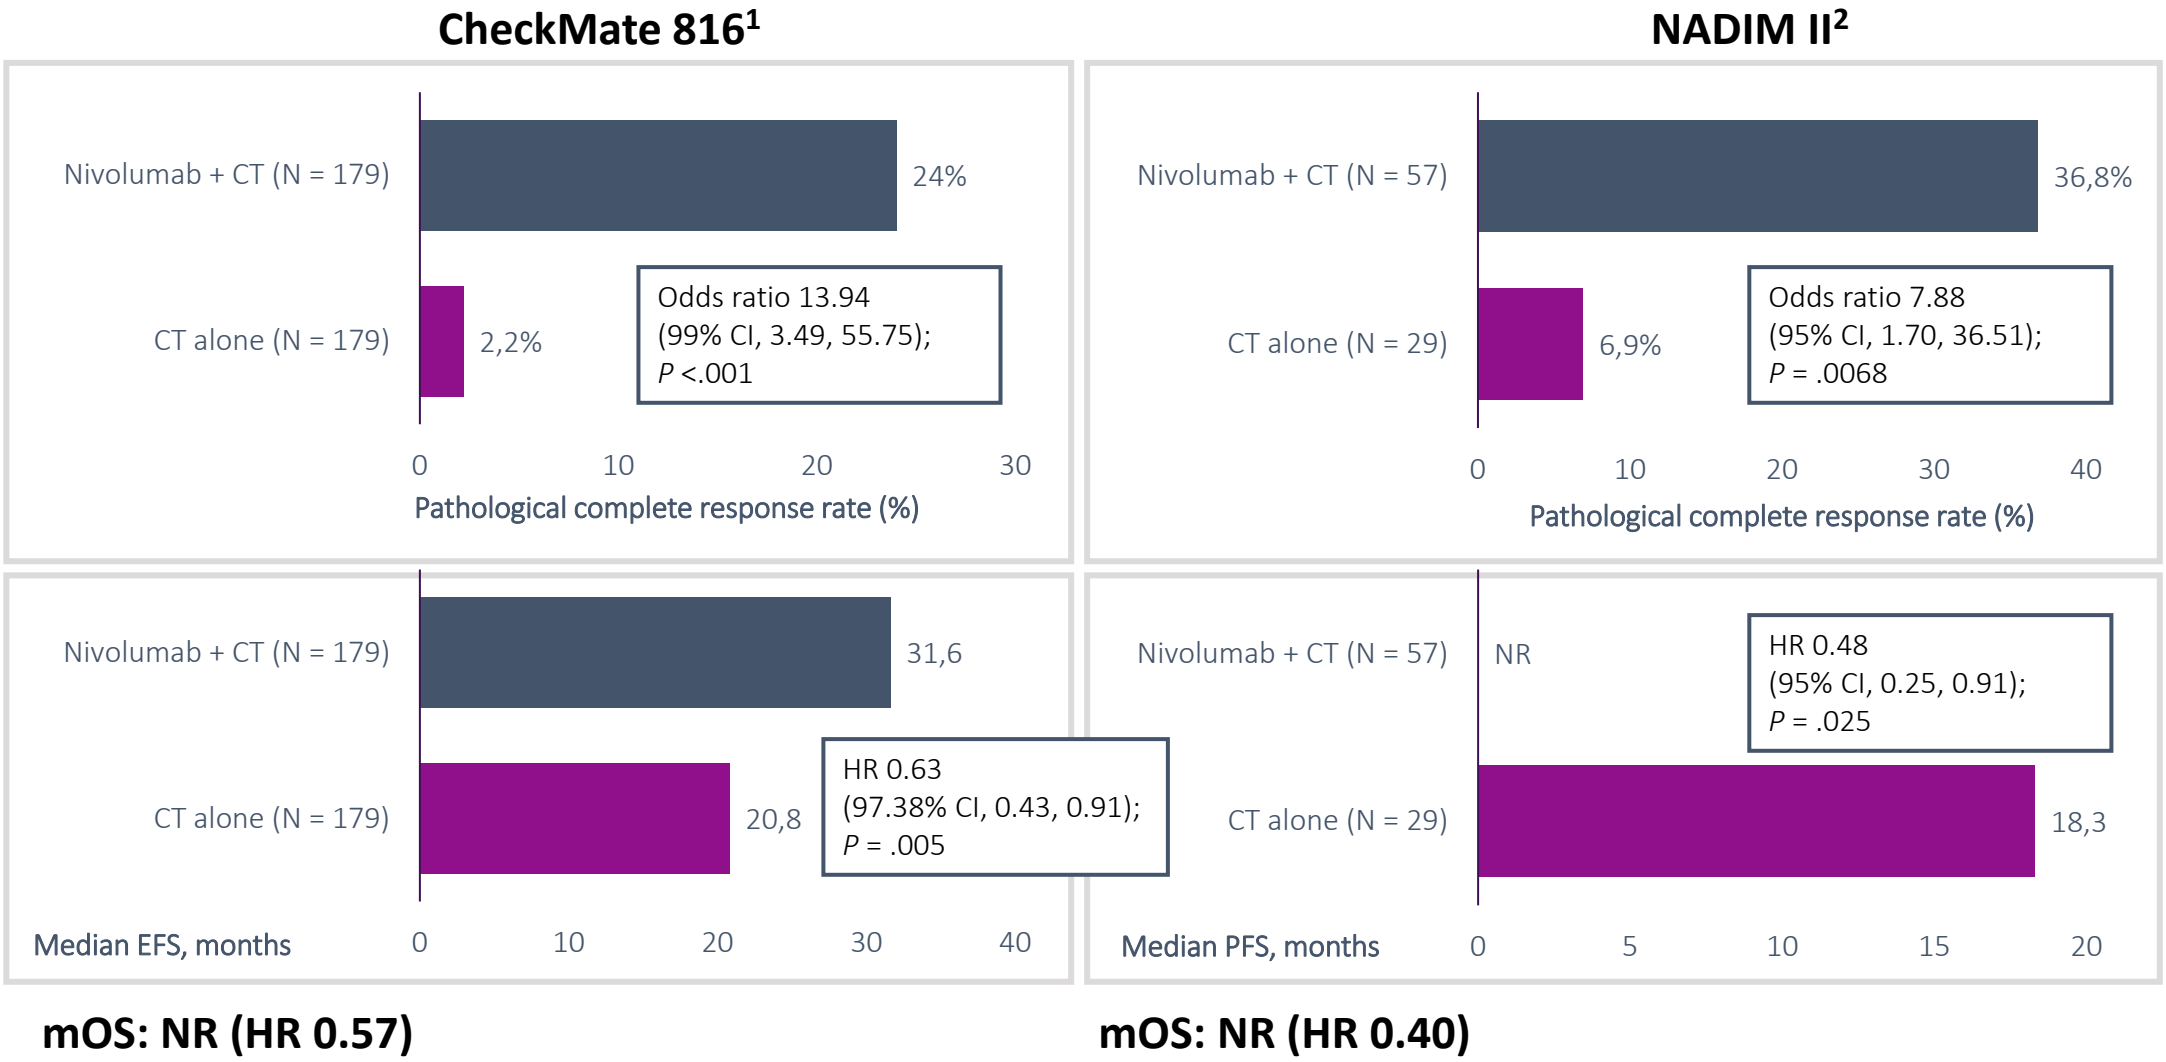
Neoadjuvant Nivolumab: Odds Ratio and EFS



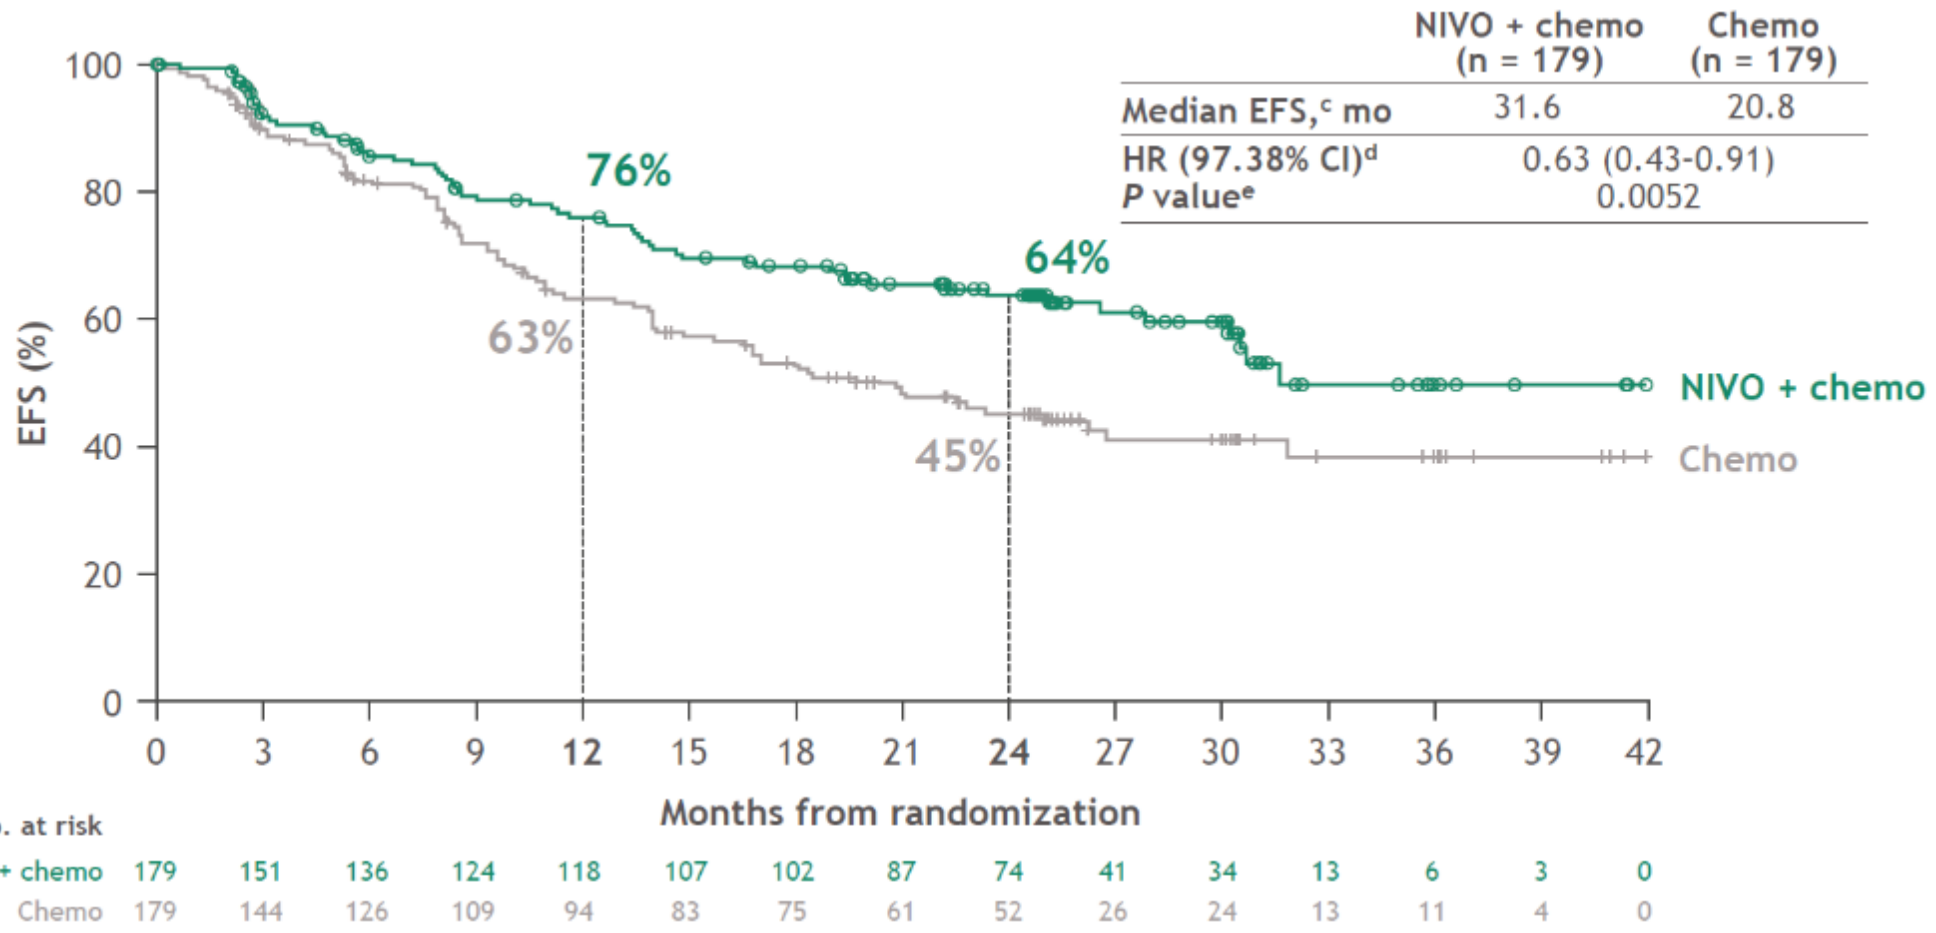
mOS: NR (HR 0.57)

mOS: NR (HR 0.40)

CT, chemotherapy; EFS, event-free survival; HR, hazard ratio; NR, not reached.

1. Forde PM, et al. *N Engl J Med.* 2018;378:1976-86; 2. Provencio M, et al. ASCO 2022. Abstract 8501.

CheckMate 816: Neoadjuvant Nivolumab + Chemotherapy Improved EFS Compared With Chemotherapy Alone

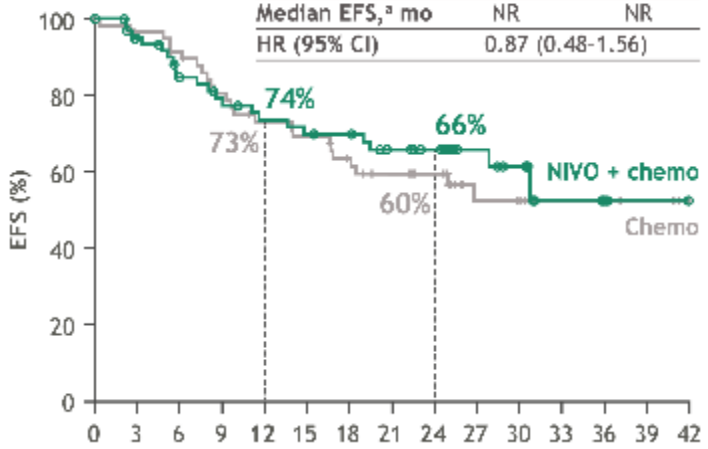


Girard, et al. AACR 2022. Abstract CT012; Forde PM, et al. *N Engl J Med.* 2022;386:1973-1985.

CheckMate 816: An EFS by Stage and PD-L1

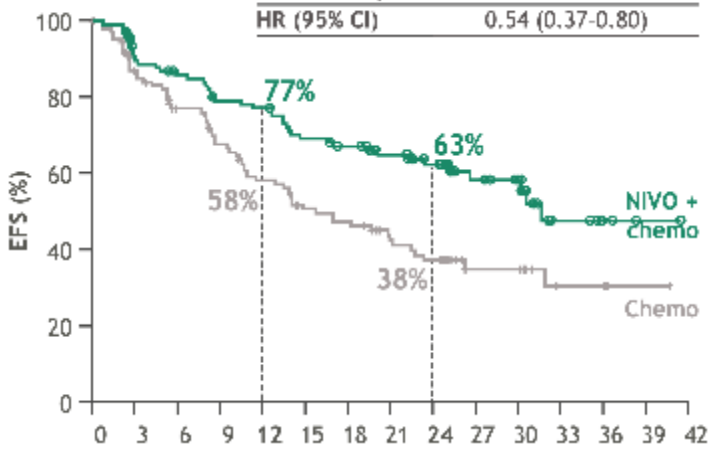
Stage IB-II

	NIVO + chemo (n = 65)	Chemo (n = 62)
Median EFS,[a] mo	NR	NR
HR (95% CI)	0.87 (0.48-1.56)	



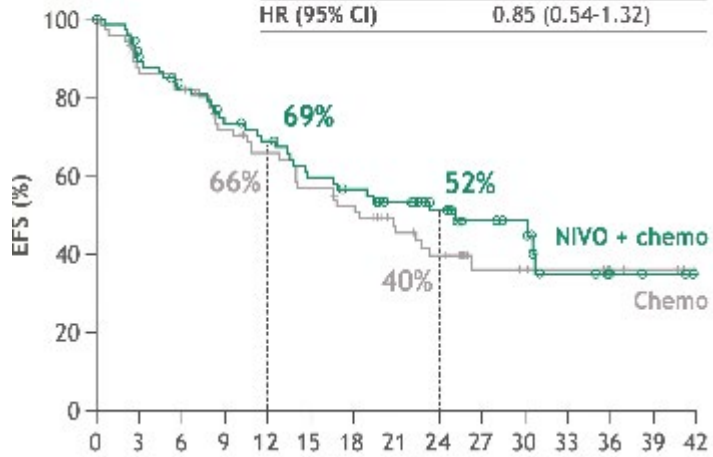
Stage IIIA

	NIVO + chemo (n = 113)	Chemo (n = 115)
Median EFS,[b] mo	31.6	15.7
HR (95% CI)	0.54 (0.37-0.80)	



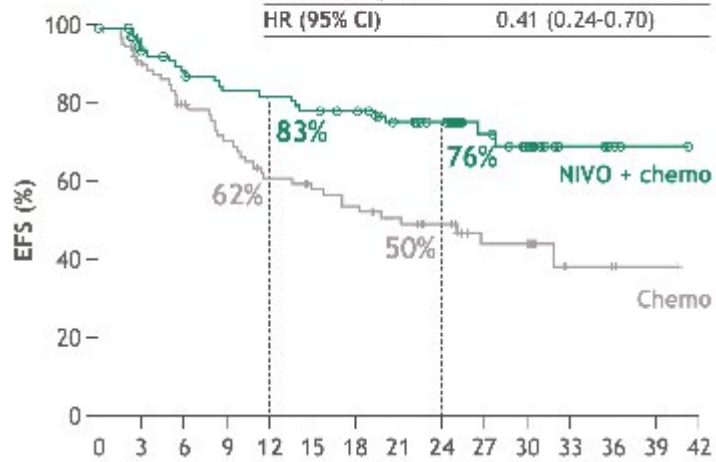
PD-L1 < 1%

	NIVO + chemo (n = 78)	Chemo (n = 77)
Median EFS,[a] mo	25.1	18.4
HR (95% CI)	0.85 (0.54-1.32)	



PD-L1 ≥ 1%

	NIVO + chemo (n = 89)	Chemo (n = 89)
Median EFS,[b] mo	NR	21.1
HR (95% CI)	0.41 (0.24-0.70)	



NADIM: Secondary Endpoints – Overall Survival

	NIVO + Chemo (n = 57)	Chemo (n = 29)
Median OS (mo)	NR	NR
HR	0.40 (95% CI 0.17–0.93); *P* = .034	

Number at risk

Nivo + chemo	56	56	55	53	37	31	15	5	1	1	1	1	1
Chemo	28	27	25	19	17	13	9	0	0	0	0	0	0

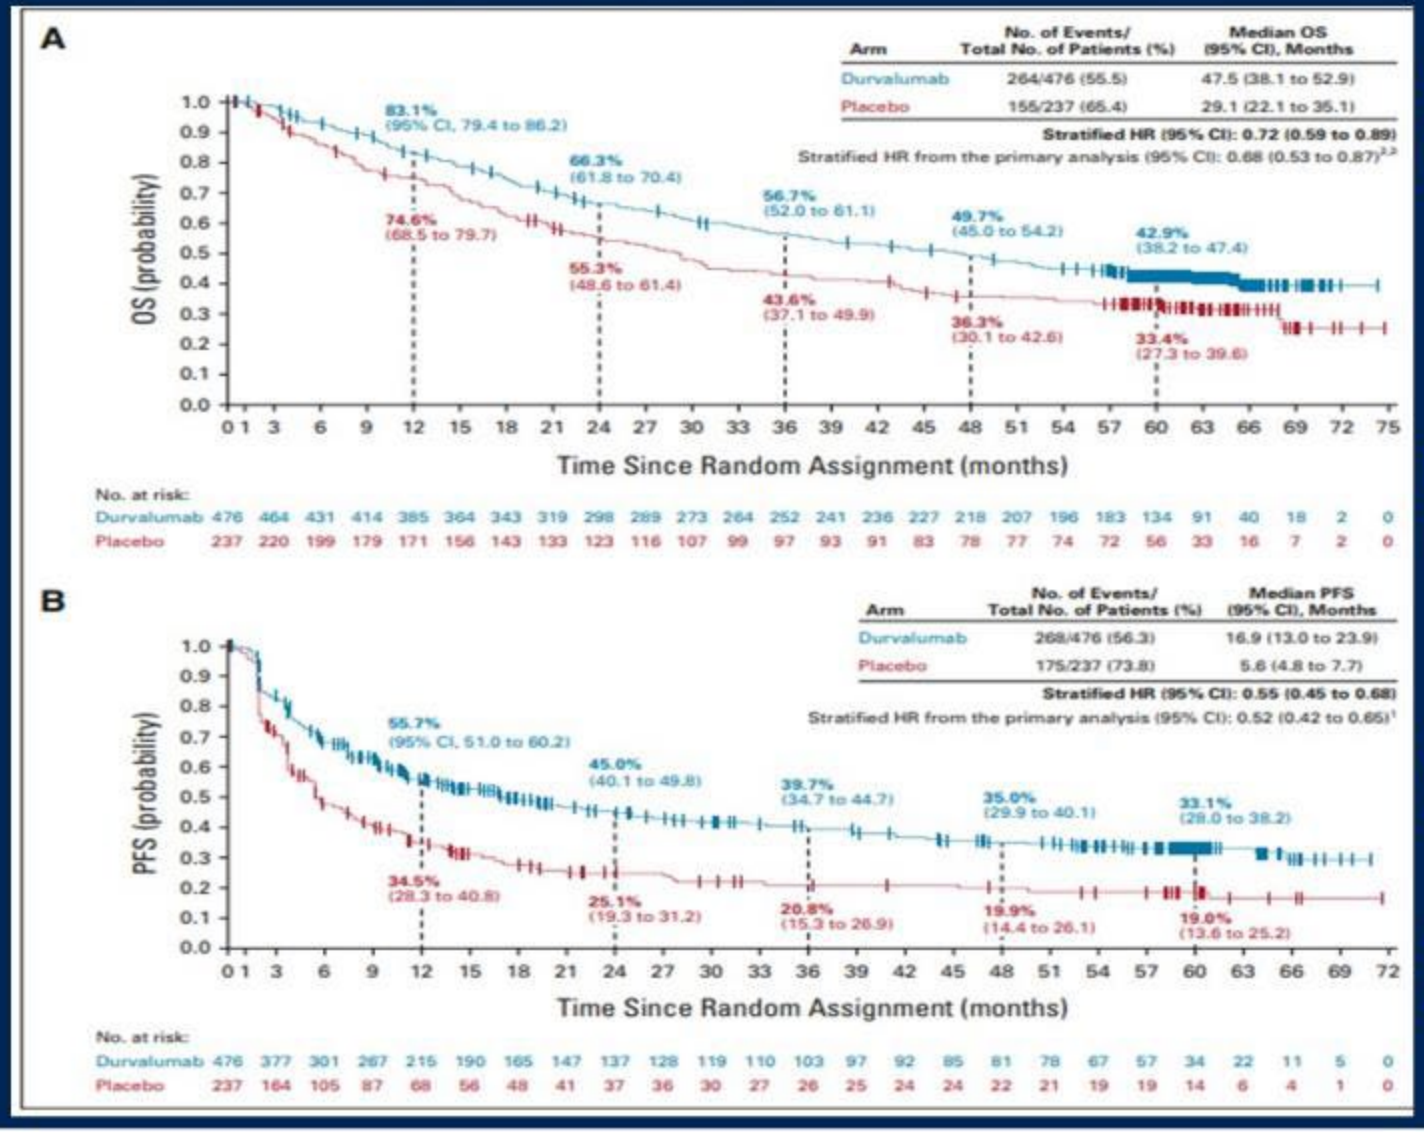
Overall survival was defined as the time from randomization to death. OS was censored on the last date a participant was known to be alive.

Dr Mariano Provencio, Hospital Universitario Puerta de Hierro-Majadahonda, Madrid, Spain.

Emerging Paradigms in Care: LA-NSCLC (ASCO)

- PACIFIC
- Abstract 8541 – COAST
- Big Ten Lung Trial
- EA5181

PACIFIC TRIAL



HR = 0.72 OS
Median 47.5 vs 29.1mn

HR = 0.55 PFS
Median 16.9 vs 5.6 mn

Entry Criteria

- No progression during the course of CHEMO/RT
- No unresolved > Grade 2 toxicities
- No Grade ≥ 2 Pneumonitis

Abstract 8541: Durvalumab (durva) After Chemoradiotherapy (CRT) in Unresectable, Stage III, *EGFR* Mutation-Positive (*EGFR*m) NSCLC: A Post Hoc Subgroup Analysis From PACIFIC

PACIFIC

- 713 pts enrolled, 35 had *EGFR* mutations (2/3 exon 19/21, 1/3 "other")
- For all pts: OS HR 0.68, PFS HR 0.52
- Of 35 EGFR mutation+ pts, 24 received durva, 11 pbo

	Placebo	Durvalumab
Male, %	73	54
IIIA, %	64	46
PS 0, %	64	54
Ind Rx, %	36	8
Asian, %	55	63
PD-L1 <25%	36	67
Med PFS, mo	10.9	11.2*
Med OS, mo	43.0	46.8**
ORR, %	18.2	26.1

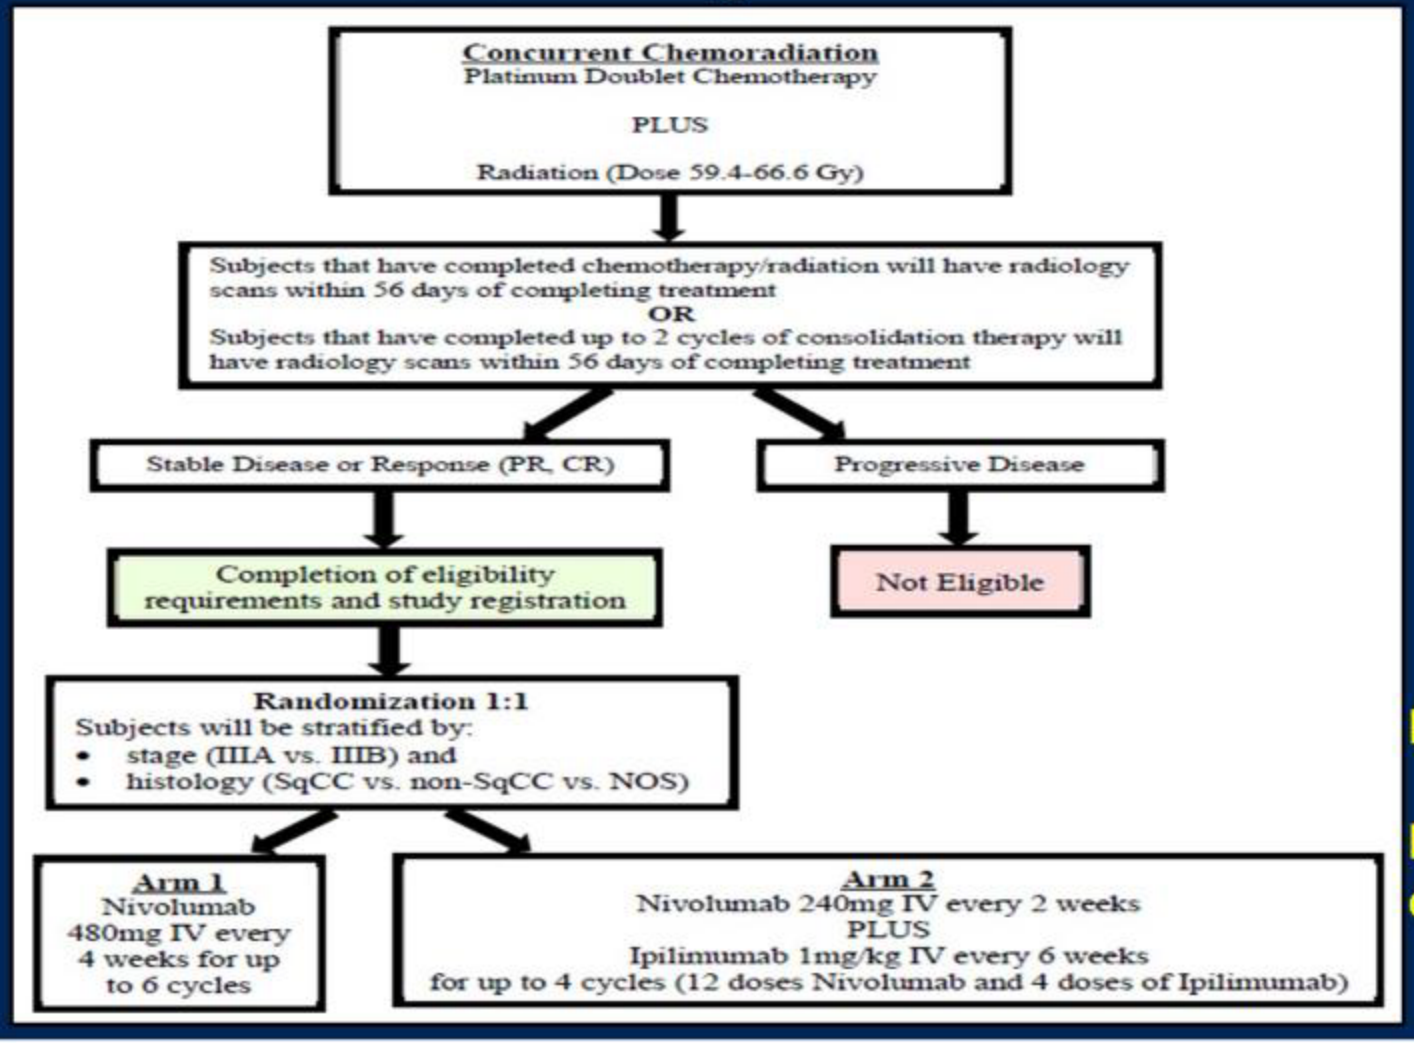
Consolidation Nivolumab Plus Ipilimumab or Nivolumab Alone Following Concurrent Chemoradiation for Patients with Unresectable Stage III Non-Small Cell Lung Cancer. Durm et al



Primary Endpoint-
18- months PFS

1. **Nivo vs historic chemoRT**
2. **Nivo/Ipi vs historic Pacific data**

Big question-

Is 6 months of consolidative immunotherapy enough?

Abstract 8509

PRESENTED BY:
John Michael Varlotto – Chief Radiation Oncology, Marshall University

Results

	Nivolumab Alone (N= 52)	Nivolumab/Ipilimumab (N= 47)
Median F/u, months (range)	28.5 (2-44.2)	29.4 (3.2-46.8)
Progression Free Survival*		
18- Month (95% CI)	64.0 (53.8-72.6)	67.7 (57.6-75.9)
P-value	<0.1	<0.1
Median, months (95% CI)	25.8 (23.0-NR)	25.4 (25.0-NR)
Overall Survival		
18- Month (95% CI)	82.8 (69.5-90.7)	85.7 (72.3-92.9)
24- Month (95% CI)	78.2 (63.9-87.3)	80.8 (66.1-89.6)
Median, months (95% CI)	NR (NR-NR)	NR (28.1-NR)

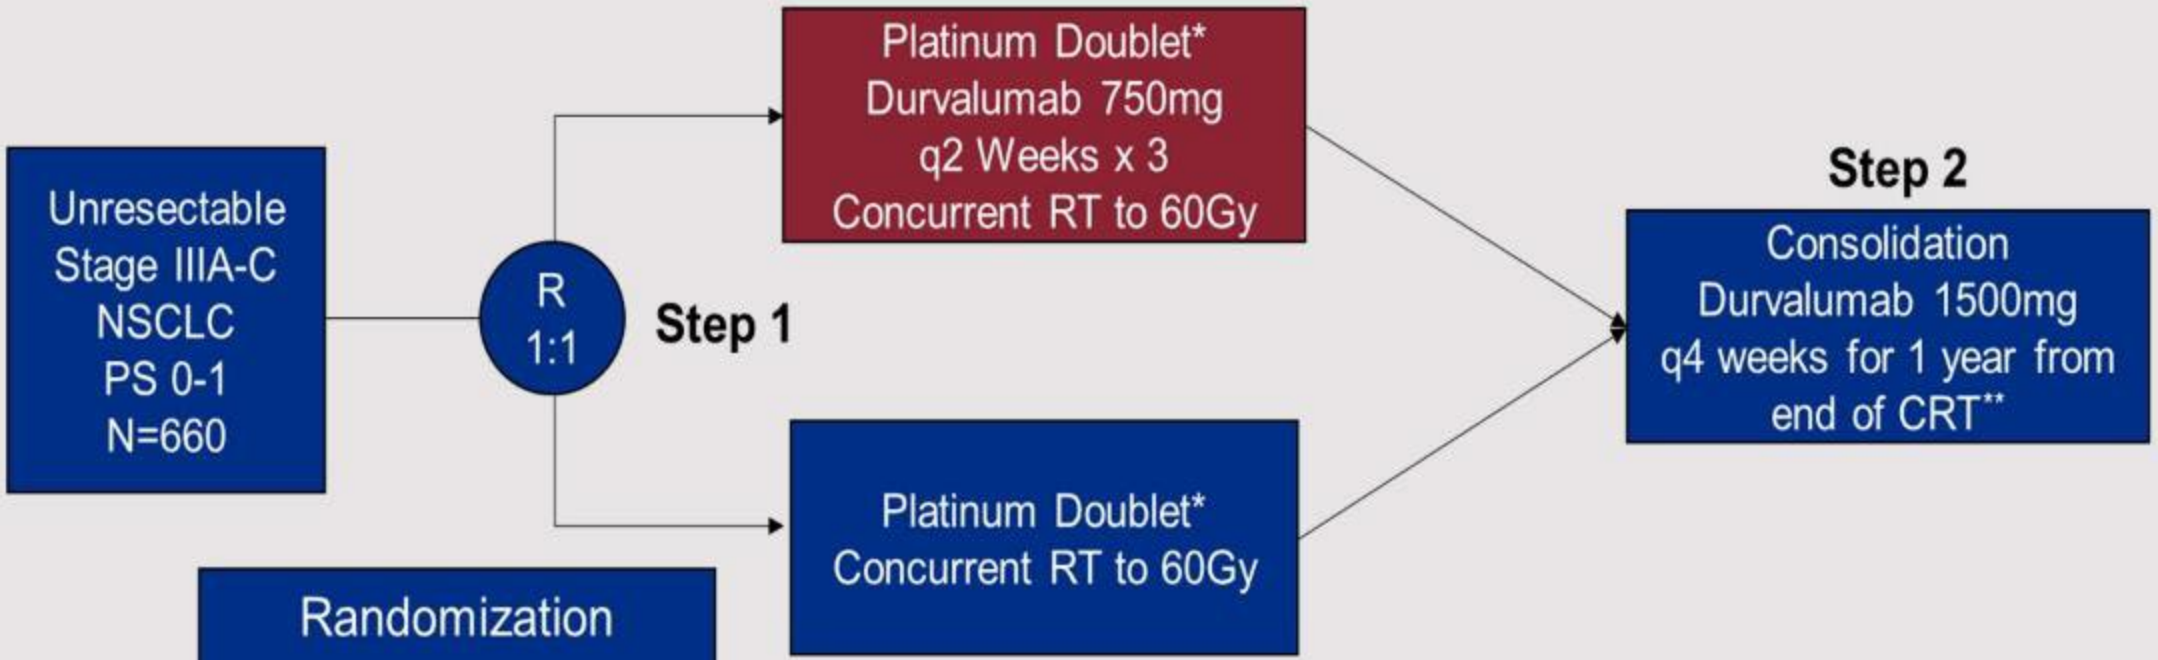
Results

	Nivolumab Alone (N= 52)	Nivolumab/Ipilimumab (N= 47)
Median F/u, months (range)	28.5 (2-44.2)	29.4 (3.2-46.8)
Progression Free Survival*		
Median, months (95% CI)	NR (NR-NR)	NR (28.1-NR)

Author	N	Population	Regimen	ORR (%)	PFS, med (mo)	Pneumonitis G3+ (%)	trAEs Gr ≥3 (%)
Durm	54	NSCLC	Chemo-RT → Nivo	NR	25.8	9.3	38.5
	51	NSCLC	Chemo-RT → Nivo-Ipi	NR	25.4	15.7	52.9

Conclusion: Ipi yields no further Tx benefit, just heightened toxicity

ECOG-ACRIN EA5181



Randomization

Stratified by:

1) Planned chemotherapy
2) Age
3) Sex
4) Stage (IIIA vs IIIB vs IIIC)

***Investigator choice**

Cisplatin 50 mg/m2 D1, 8, 29, 36; etoposide 50 mg/m2 D1-5, 29-33
Cisplatin 75 mg/m2 D1, 22; pemetrexed 500 mg/m2 D1, 22 (nonsquamous only)
Carboplatin AUC 2 D1, 8, 15, 22, 29, 36; paclitaxel 45 mg/m2 D1, 8, 15, 22, 29, 36

**Starting within 14 days of CRT unless toxicity has not resolved to ≤ grade 2, but not later than 45 days post-CRT

Metastatic NSCLC: Can We Further Personalize First-Line Treatment?

2022 ASCO® ANNUAL MEETING

FDA

Outcomes of anti-PD-(L)1 therapy with or without chemotherapy (chemo) for first-line (1L) treatment of advanced non-small cell lung cancer (NSCLC) with PD-L1 score ≥50%: FDA Pooled Analysis

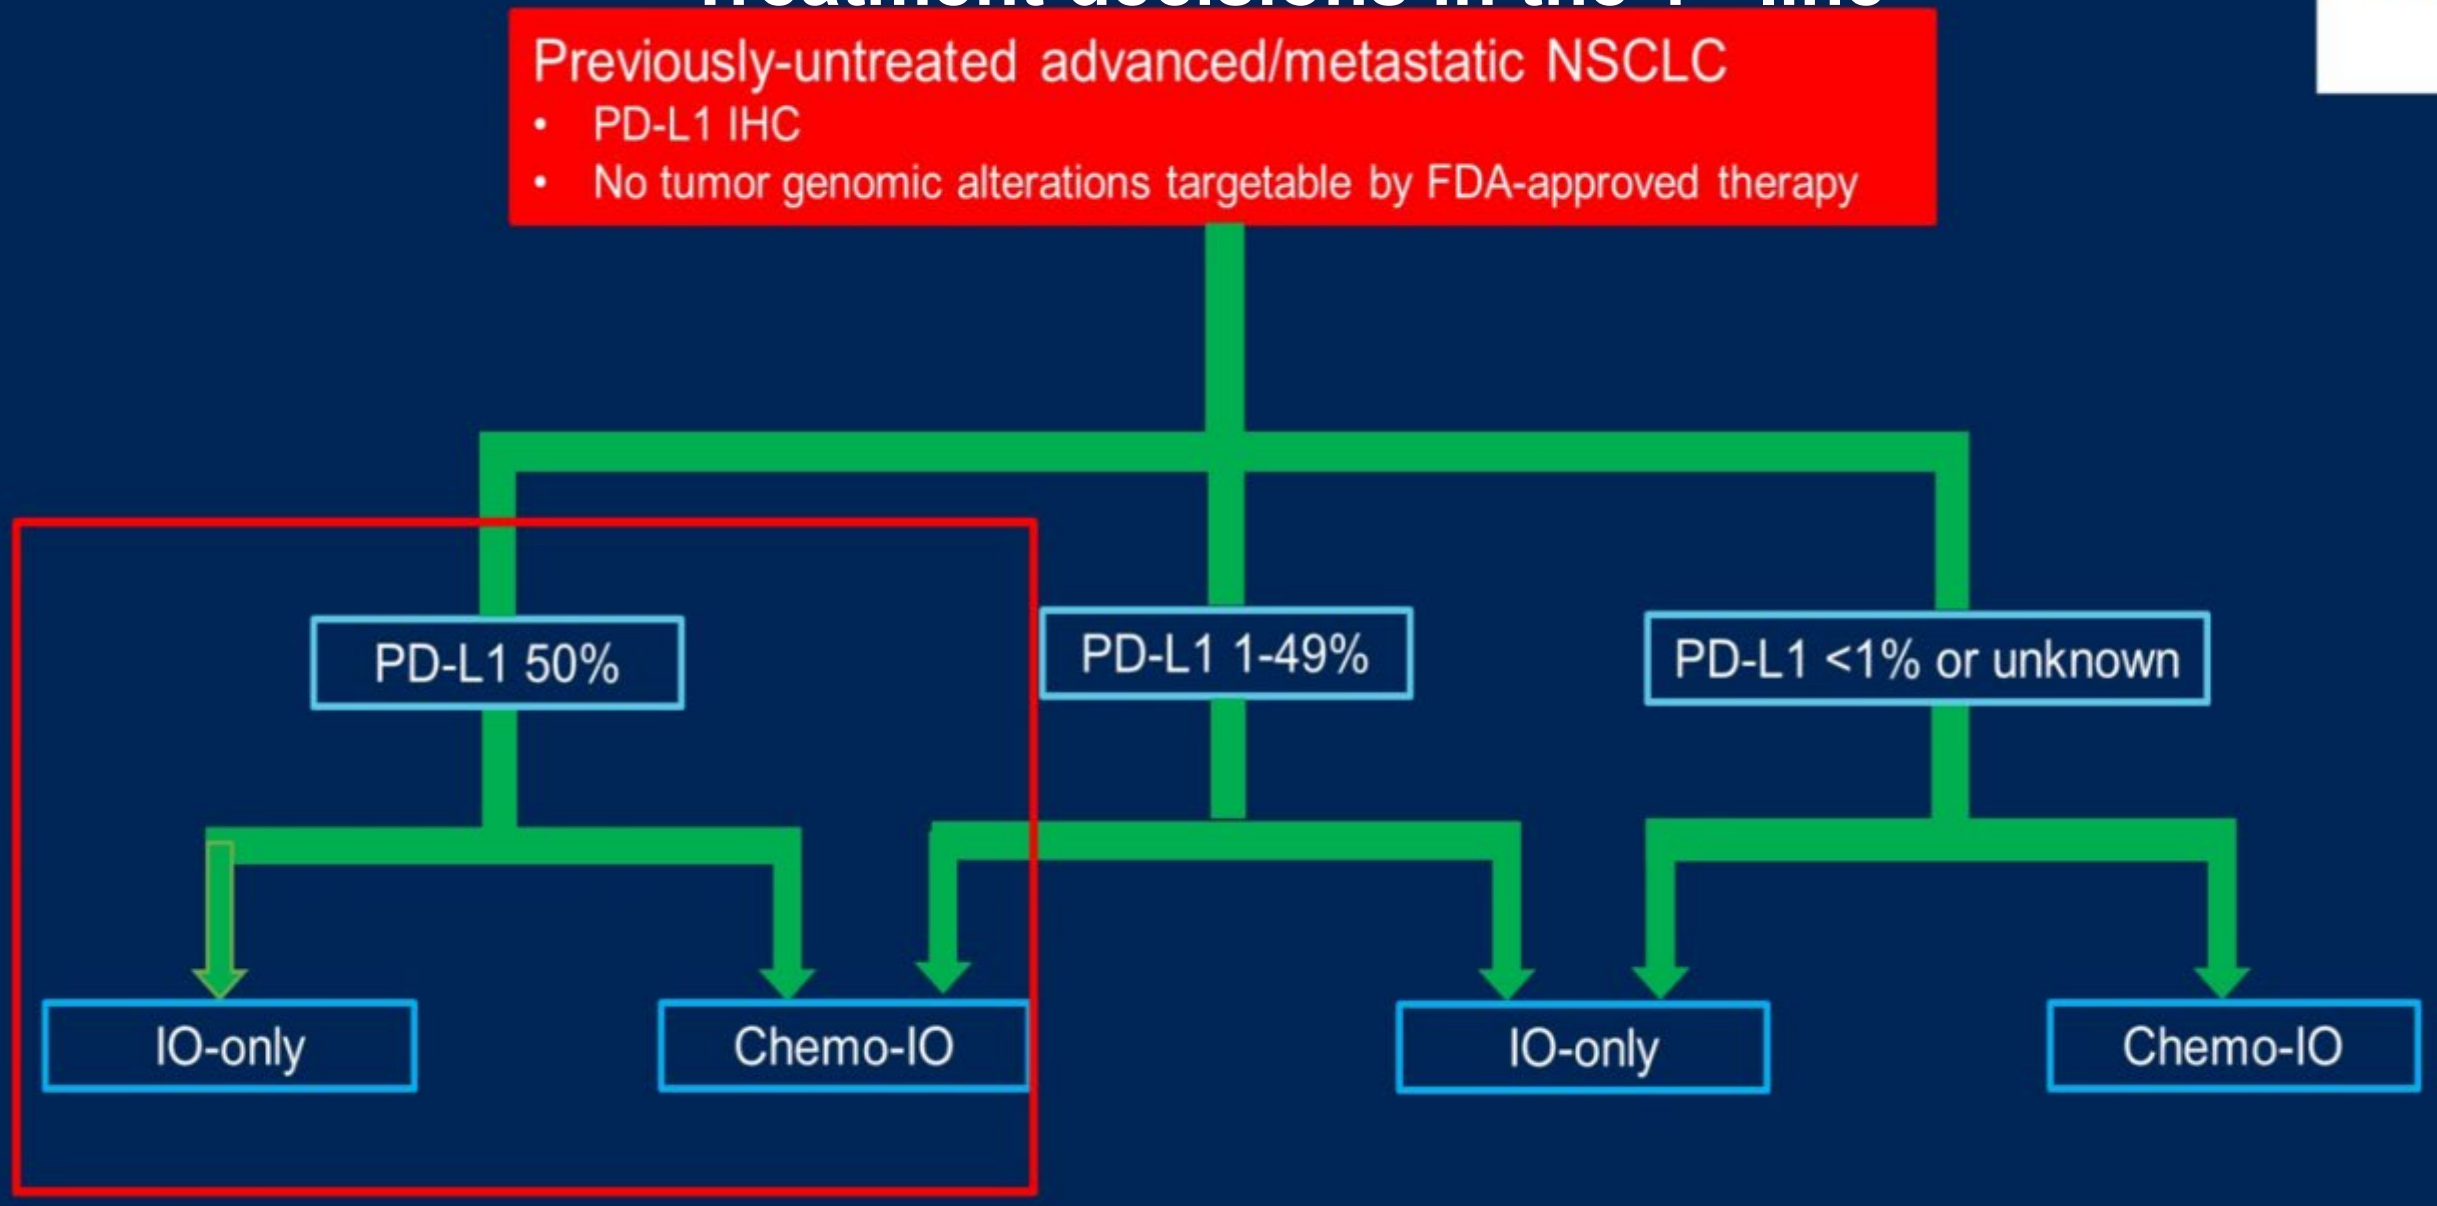
Oladimeji Akinboro[1], Jonathon Vallejo[1], Erica Nakajima[1], Yi Ren[1], Pallavi Mishra-Kalyani[1], Erin Larkins[1], Paz Vellanki[1], Nicole Drezner[1], Mathieu Luckson[1], Shenghui Tang[1], Martha Donoghue[1,2], Richard Pazdur[1,2], Julia A. Beaver[1,2], Harpreet Singh[1,2]

[1]Center for Drug Evaluation and Research, U.S. Food and Drug Administration

[2]Oncology Center of Excellence, U.S. Food and Drug Administration

Oladimeji Akinboro, MD, MPH

Treatment decisions in the 1st line

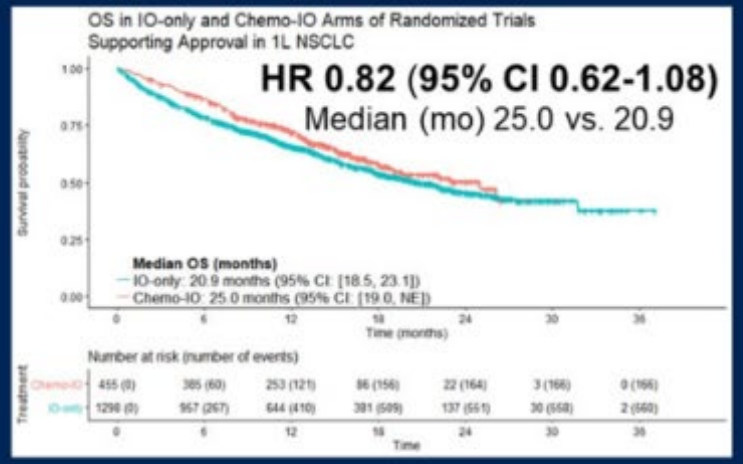


Abbreviations: Chemo-IO=platinum-based doublet chemotherapy plus immunotherapy; IO=immunotherapy; NSCLC=non-small-cell lung cancer; PD-L1=programmed death ligand-1.

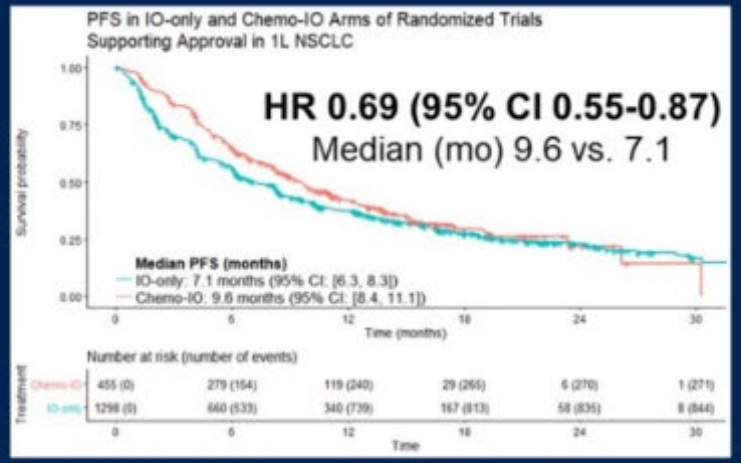
IO vs Chemo-IO in PD-L1 ≥50%

- **Randomized Clinical Trials supporting FDA approved IO-based regimens**
  - **Chemo-IO (6 trials, n=455):** Platinum-Chemo + Pembrolizumab, Atezolizumab (+/- bevacizumab), or Nivolumab/Ipilimumab
  - **IO (6 trials, n=1298):** Nivolumab, Pembrolizumab, Atezolizumab, Cemiplimab, Nivolumab/Ipilimumab
- **Biomarkers[1]: PD-L1 ≥ 50% TPS and *EGFR/ALK* WT**

OS – no difference



PFS – favor chemo-IO



ORR – favor chemo-IO

	Chemo-IO	IO
% (95% CI)	61 (56, 66)	43 (41, 46)
Odds ratio (95% CI)	**1.2** (1.1, 1.3)	

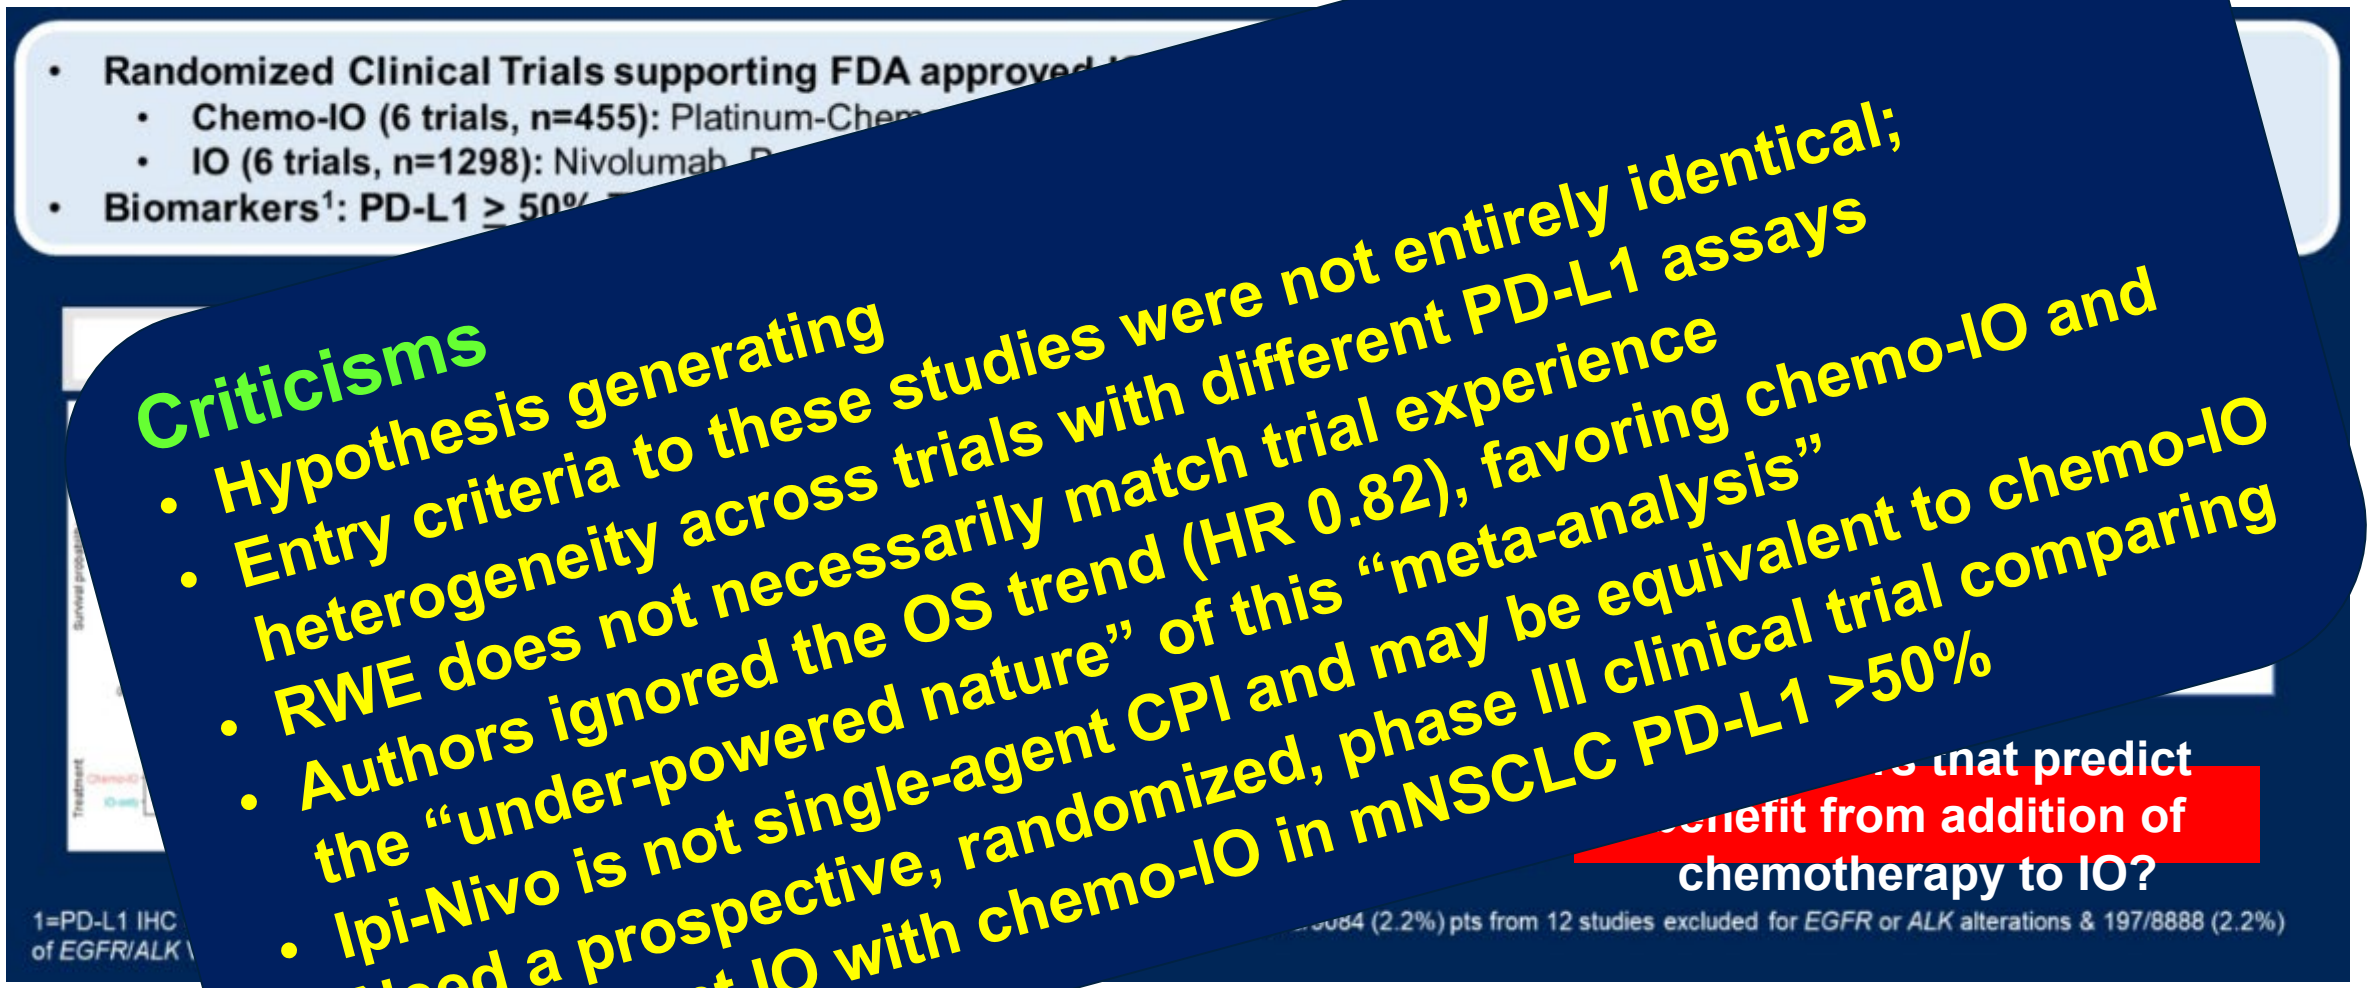
Risk factors that predict benefit from addition of chemotherapy to IO?

1=PD-L1 IHC defined by tumor proportion score (TPS) and excluded staining by tumor infiltrating lymphocytes; 2=196/9084 (2.2%) pts from 12 studies excluded for *EGFR* or *ALK* alterations & 197/8888 (2.2%) of *EGFR/ALK* WT pts excluded as no baseline PD-L1 IHC results.

Adapted from ASCO 2022 presentations by Sukhmani Padda, O. Akinboro.

Penn Medicine Abramson Cancer Center

IO vs Chemo-IO in PD-L1 ≥50%



Criticisms

- Hypothesis generating
- Entry criteria to these studies were not entirely identical; heterogeneity across trials with different PD-L1 assays
- RWE does not necessarily match trial experience
- Authors ignored the OS trend (HR 0.82), favoring chemo-IO and the "under-powered nature" of this "meta-analysis"
- Ipi-Nivo is not single-agent CPI and may be equivalent to chemo-IO
- Need a prospective, randomized, phase III clinical trial comparing single agent IO with chemo-IO in mNSCLC PD-L1 >50%

Adapted from ASCO 2022 presentations by Sukhmani Padda, O. Akinboro.

Penn Medicine Abramson Cancer Center

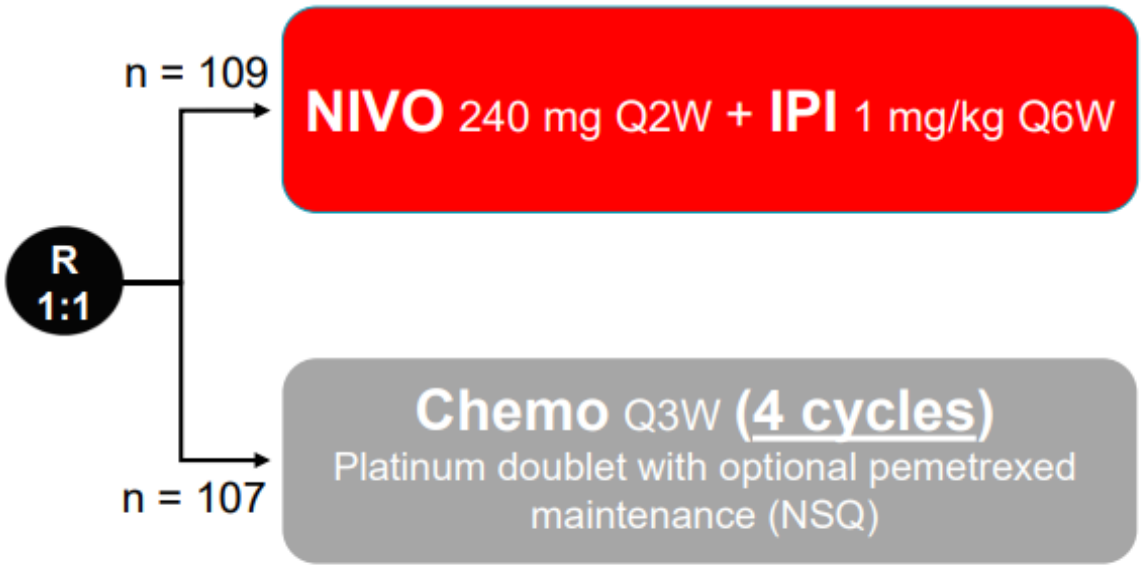
eNerGy : a study dedicated to elderly and PS2 patients

Key Eligibility Criteria

- Stage IV or recurrent
- Squamous or Non-Squamous
- No prior systemic therapy for advanced disease
- No known EGFR mutations or ALK or ROS1 alteration
- Age ≥ 70 ECOG PS 0-1 or PS 2

Stratified by :
· Age ≥ versus < 70 years
· PS 0/1 versus 2
· Histology : squamous/non-squamous



Until disease progression, unacceptable toxicity, *or* for 2 years for immunotherapy

Primary endpoint
- OS

Secondary endpoints
- PFS
- ORR
- Efficacy by tumor PD-L1 expression
- QOL, geriatric mini dataset

Statistical Plan

- 242 patients had to be randomized with 199 events to detect a treatment effect hazard ratio (HR) of 0.65 with 85% power, translating in an improvement of 1-year OS rate from 40% (control arm) to 55% (NIVO-IPI), and using a log-rank test at a 2-sided alpha level of 5%.
- One preplanned interim analysis for futility occurred in December 2019, after that 33% of the expected events have occurred.
- Regarding low effect on PS 2 patients, the DMC recommended to stop inclusion, 217 patients had been randomized at that time.
- Final analysis is performed on the ITT population

Baseline characteristics

	NIVO + IPI (n = 109)	Chemo (n = 107)
Age, median (range), years	74 (52-89)	74 (51-88)
≥ 70	78%	79.4%
Female, %	32.1	25.2

HR (95% CI)	**0.63** (0.42–0.95)	

Safety

	NIVO IPI %	Chemo %
TRAEs all grades	74.3	89.3
TRAEs grade ≥3	31.4	49.5
TRAEs leading to discontinuation of any component of the regimen	54.3	34.0
TRSAEs	39.0	25.2
Treatment-related deaths	3.8*	1.9**

*Hyperprogression 1 (PS 2, 76 yo), Pneumonitis 1 (PS 0 76 yo), Encephalitis 1 (PS 1 74 yo), sudden death 1 (PS 2 63 yo)

**Septic schock 2 (PS 0 79 yo, PS 1 71 yo)

Conclusion

- In this elderly and/or PS2 advanced NSCLC, we observed a non significant advantage of NIVO IPI compared to platinum doublet chemo for OS, PFS 1 year.
- Nivo-Ipi appeared deleterious for PS2 patients compared to chemo.
- In subgroup analysis of elderly PS 0/1 patients, OS was significantly increased with NIVO IPI over chemo :
  - 22.6 (18.1-36) versus 11.8 (8.9-20.5) months.
- No new signal of toxicity of NIVO IPI in elderly and/or PS2 population was observed
- Pending QOL, geriatric parameters analysis and 2nd line therapies will be presented later.

- **Dedicated trials for elderly population, PS 2 are feasible and remain essential**

Langer's Current Paradigm: 2022 (could change at any moment)

Tx Cohort	Non-squamous	Squamous
PD-L1 ≥50%	Pembro > Pem-Carbo-Pembro	Pembro > Taxane-Carbo-Pembro
PD-L1 1%–50%	Pem-Carbo-Pembro > Pembro	Taxane-Carbo-Pembro > Pembro
PD-L1 <1%	Pem-Carbo-Pembro	Taxane-Carbo-Pembro
PD-L1 <1%, TMB >10	Pem-Carbo-Pembro vs Ipi-Nivo*	Taxane-Carbo-Pembro vs Ipi-Nivo*
TKI refractory	Pem-Carbo ± Bev or Pac-Carbo-Bev-Atezo (IMP150)	
Tissue QNS	Pem-Carbo-Pembro	Taxane-Carbo-Pembro

*Ipilimumab-nivolumab ± 2 cycles of histology-appropriate chemotherapy (9LA).

CPIs: Unanswered Questions for First Line

- Are there biomarkers to aid patient selection beyond PD-L1?
- How to choose monotherapy vs combination?
- Role of CPI combinations vs Pembro-chemo?
  - Need a trial comparing 9LA with Pembro + histology-specific chemo
- **Other unanswered questions**
  - Optimal number of chemo cycles?
  - Can we extend Tx intervals?
  - Maintenance pemetrexed in those with high PD-L1 expression?
  - Mechanisms of resistance?
  - Additional compounds?

Metastatic wtNSCLC: Role of Second-Line Immunotherapy

2022 ASCO® ANNUAL MEETING

Association of comprehensive molecular genotyping and overall survival in patients with advanced non-squamous non-small cell lung cancer

Charu Aggarwal, Melina E. Marmarelis, Wei-Ting Hwang, Dylan G. Scholes, Tara L. McWilliams, Aditi P. Singh, Lova Sun, John Kosteva, Michael R. Costello, Roger B. Cohen, Corey J. Langer, Peter E. Gabriel, Lawrence N. Shulman, Jeffrey C. Thompson, Erica L. Carpenter

Abramson Cancer Center,
University of Pennsylvania
Philadelphia, PA, United States

Background/Methods:

- We analyzed the impact of concurrent tissue (T) and plasma (P) based next generation sequencing (NGS) upon comprehensiveness of molecular genotyping and overall survival (OS).

Methods:

- Retrospective cohort study of patients with newly diagnosed Stage IV non-squamous NSCLC treated at our institution between 1/2019 -12/2020
- Categories of NCCN guideline concordant testing were defined as follows:
  i. Comprehensive: *EGFR, ALK, BRAF, ROS1, MET, RET, NTRK* testing
  ii. Incomplete: 2-6 genes tested
  iii. No molecular testing

Statistics:

- Proportion of patients with comprehensive molecular testing performed, prior to first line and by modality (T NGS vs. T+P NGS), were compared using Fisher's exact test.
- Median OS was estimated using Kaplan-Meier methodology from diagnosis to death or censored at most recent follow-up.

Figure 1. Consort Diagram

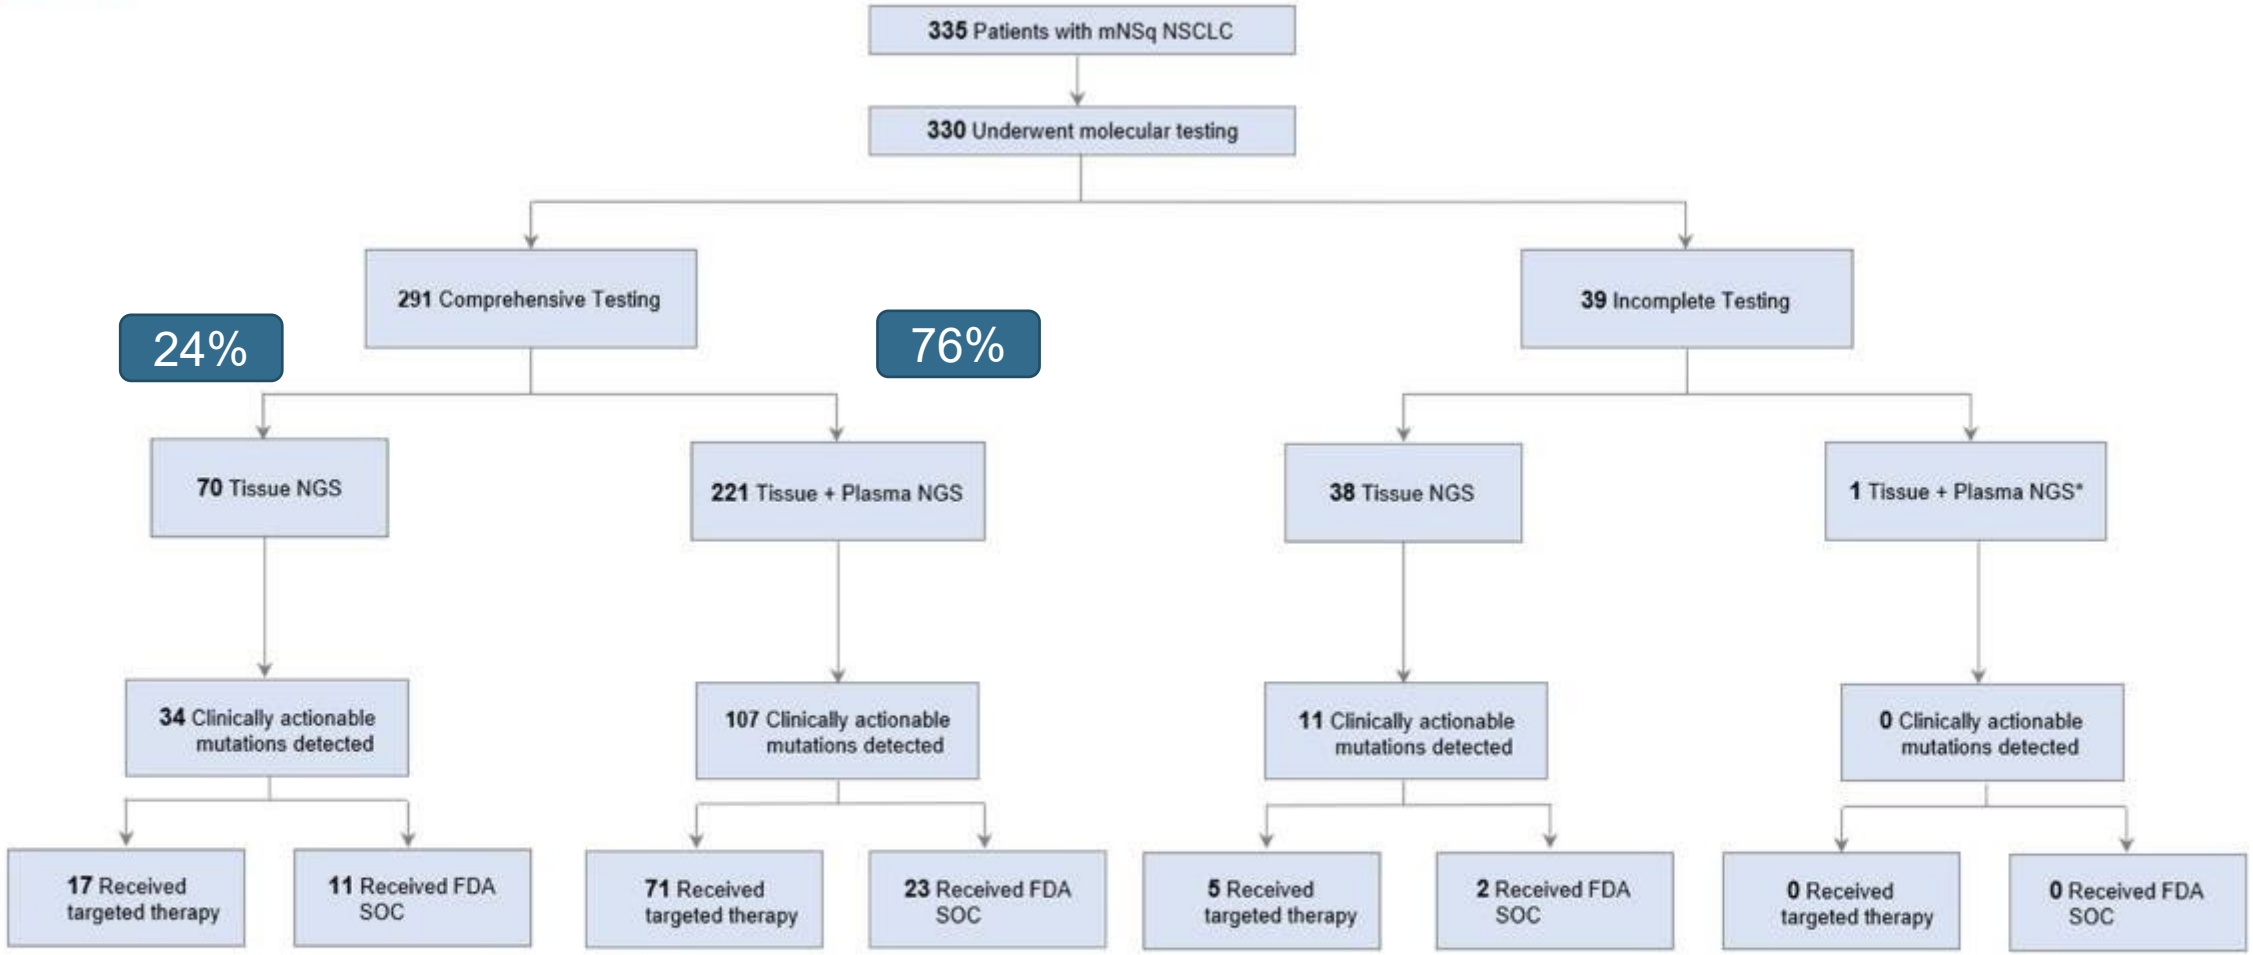

Fig 1.
Flowchart summarizes the overall patient enrollment and the number of clinically actionable mutations detected (*EGFR, ALK, BRAF, ROS1, MET, RET, NTRK1,2* and *3*, *KRAS* G12C, and *ErbB2)* on Tissue vs. Tissue + Plasma NGS for patients with comprehensive testing as well as for those with incomplete/no testing. NGS, next-generation sequencing; FDA, Food and Drug Administration; SOC, standard of care.

Comprehensive molecular genotyping and overall survival

Patients with comprehensive molecular genotyping had superior OS (22.1 months, 95% CI 14.62 – NA), compared to those with incomplete or no testing (11.6 months, 95% CI 3.61 – NA), p=0.02, likely mediated by delivery of targeted therapy

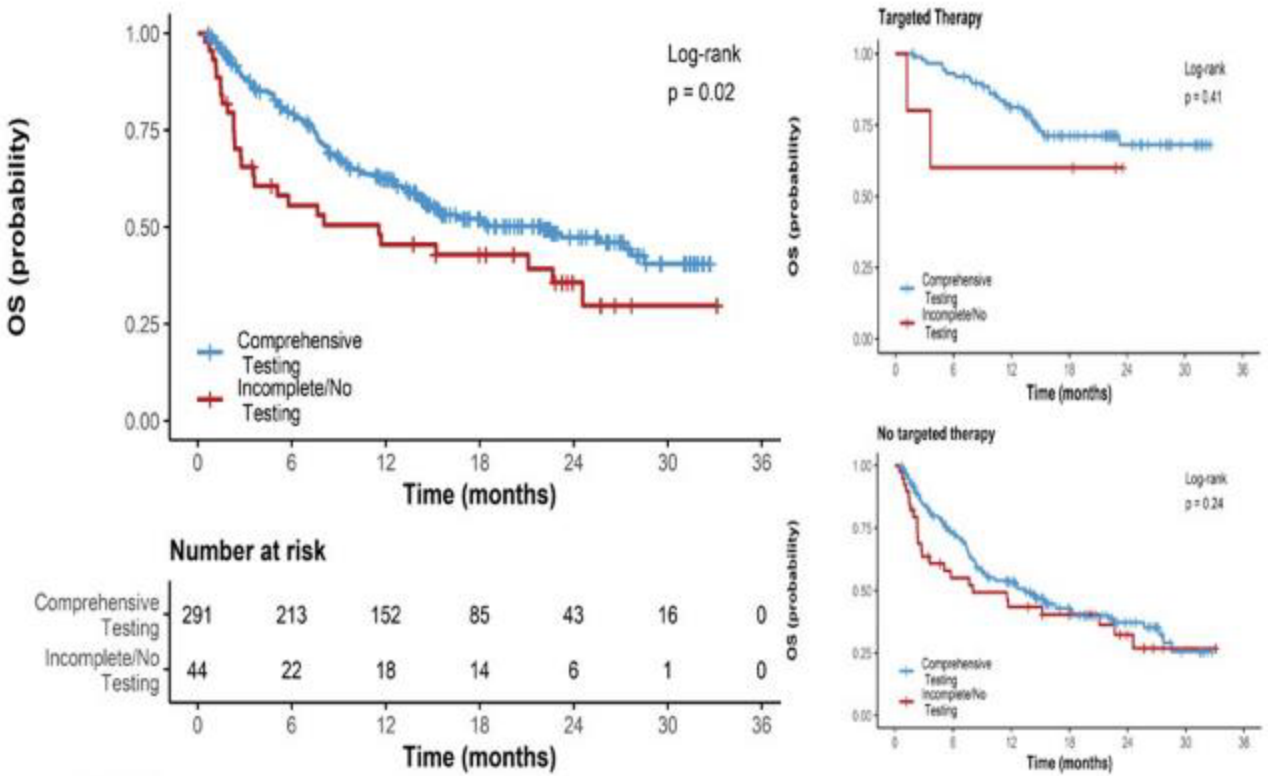

Fig 1.
Kaplan-Meier curve for OS of patients with comprehensive testing compared to patients with incomplete/no testing.

Availability of molecular genotyping results prior to first line therapy was associated with an improvement in OS (24.57 months, 95% CI, 18.56– NR), compared to patients without results available prior to first line therapy (6.18 months, 95% CI, 2.83 – 10.3), p<0.0001

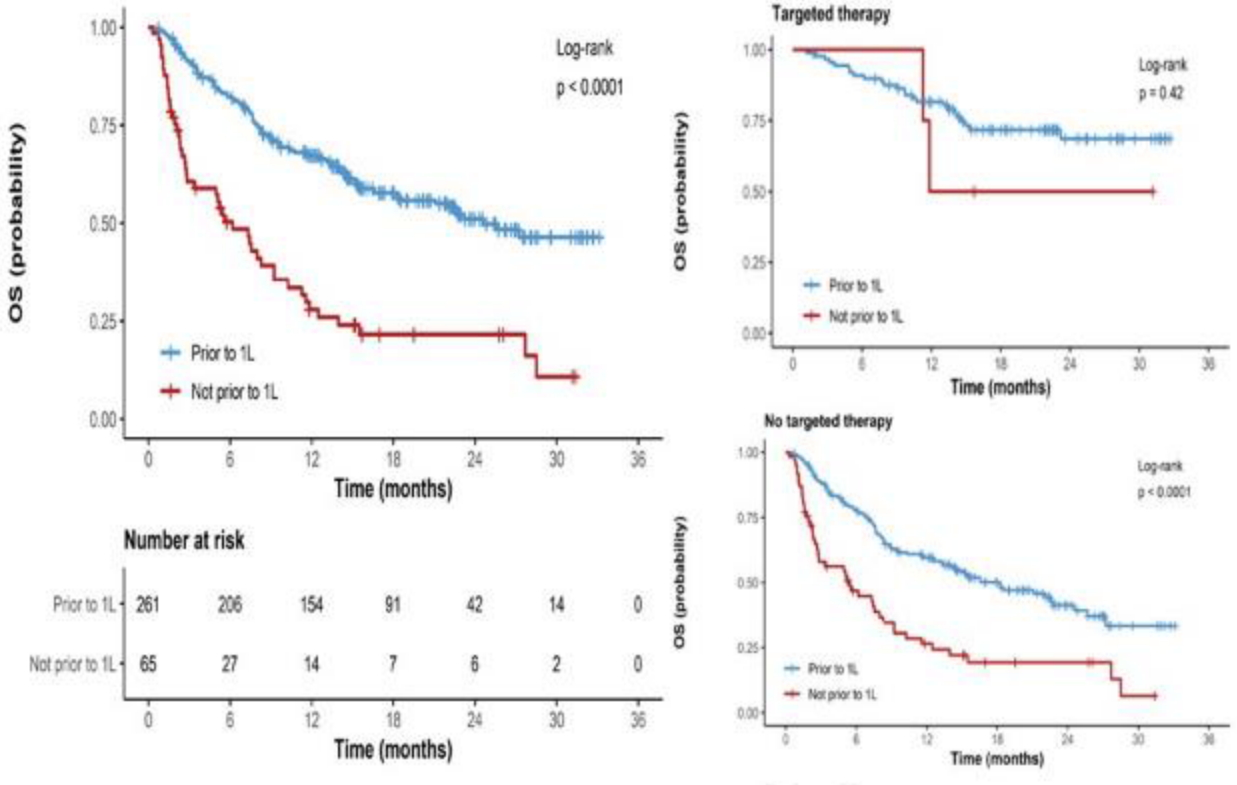

Fig 2.
Kaplan-Meier curve for OS of patients with comprehensive testing back prior to first line treatment compared to patients with results not back prior to first line treatment.

NGS: Implications for Clinical Practice

Tissue for NGS testing

- Should be obtained, if safe and feasible, both at diagnosis as well as at progression after primary targeted therapy
- At a minimum, test all adenocarcinomas regardless of smoking history, all never smokers or remote, former smokers regardless of histology

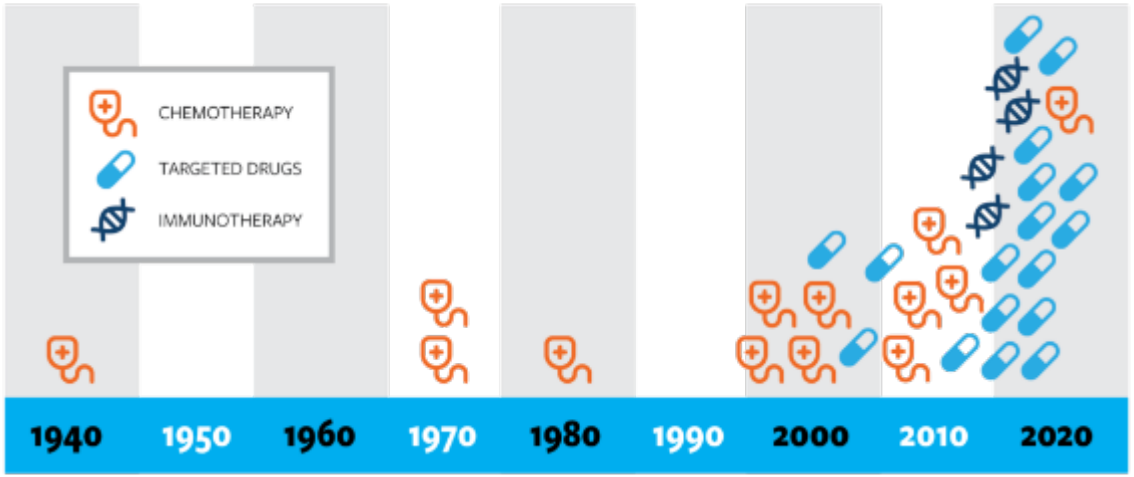
Liquid biopsy for NGS testing

- Obtainable at diagnosis, often concurrently with tissue testing; quick TAT
- Especially useful if burden of disease is on the higher side
- May be negative, especially if disease burden is low or confined to the thorax
- Early institution, in conjunction with standard tissue testing, can lead to improved outcome
- Often useful in detecting mechanisms of resistance after primary TKI therapy
- Evolving role in monitoring efficacy of therapy, both in the neoadjuvant setting and in advanced NSCLC

KRAS-Targeted Therapy: Beyond Sotorasib

KRAS G12C

- *KRAS* mutations are prevalent in NSCLC
- *KRAS* G12C present in 13% of lung adenocarcinoma
- Previously undruggable due to protein shape
- **NOW** with an FDA-approved targeted therapy and others in development



2021
Mobocertinib – *EGFR* exon20
Sotorasib – *KRAS* G12C
Amivantamab – *EGFR* exon 20
Tepotinib – *MET* exon 14 skipping

2020
Pralsetinib – *RET*
Brigatinib – *ALK* 1L
Capmatinib – *MET* exon 14 skipping
Selpercatinib – *RET*

2019
Entrectinib – *NTRK*, *ROS1* fusions

2018
Lorlatinib – *ALK*
Larotrectinib – *NTRK* fusion
Dacomitinib – *EGFR*

Progression-Free Survival

Sotorasib
ORR 37.1%

Adverse Events (AEs)

Treatment-related AEs	Sotorasib phase II (n = 126)	Adagrasib phase II (n = 116)
Treatment-related AEs		
Any grade	69.8%	97.4%
≥Grade 3	20.6%	43.1%
Leading to dose reduction	22.2%	51.7%
Leading to treatment D/C	7.1%	6.9%

Most Common TRAEs

	Any grade	≥Grade 3	Any grade	≥Grade 3
Nausea	19%	0	62.1%	4.3%
Diarrhea	31.7%	4%	62.9%	0.9%
Vomiting	7.9%	0	47.4%	0.9%
Fatigue	11.1%	0	40.5%	4.3%
ALT increase	15.1%	6.3%	27.6%	4.3%
AST increase	15.1%	5.6%	25%	3.4%

ALT, alanine transaminase; AST, aspartate transaminase.

Skoulidis F, et al. *N Engl J Med*. 2021;384:2371-2381; Janne PA, et al. *N Engl J Med*. 2022;387:120-131.

CodeBreaK 200 Phase 3 Study Design

Key eligibility criteria

- Locally advanced/unresectable or metastatic *KRAS* G12C-mutated NSCLC
- **≥ 1 prior treatment including platinum-based chemotherapy and checkpoint inhibitor***
- **No active brain metastases**
- ECOG performance status ≤ 1

Stratification factors

- Prior lines of therapy (1 vs 2 vs > 2)
- Race (Asian vs non-Asian)
- History of CNS involvement (yes vs no)

Randomisation 1:1 (N = 345)

- **Sotorasib 960 mg oral daily N = 171**
- **Docetaxel 75 mg/m² IV Q3W N = 174**

Primary Endpoint: PFS by BICR

Secondary Endpoints: Efficacy (OS†, ORR, DOR, TTR, DCR)**, safety/tolerability, PRO**

ITT population analysis included all randomised patients

Per regulatory guidance, protocol was amended to reduce planned enrolment from 650 to ~330 patients, and crossover from docetaxel to sotorasib was permitted.

Enrollment period: June 4, 2020 to April 26, 2021; protocol amendment: February 15, 2021; data cutoff: August 2, 2022.

NCT04303780; EudraCT: 2019-003582-18.

*Treatment with chemotherapy and checkpoint inhibitor could be concurrent or sequential; patients with medical contraindication to these therapies could be included with approval.

†Analysis of OS planned if PFS was found to be statistically significant and when at least 198 OS events have been reached.

Melissa L. Johnson, MD
Twitter: @MLJohnsonMD2

Primary Endpoint: PFS by BICR

	Sotorasib 960 mg oral daily (N = 171)	Docetaxel 75 mg/m² IV Q3W (N = 174)
HR (95% CI)†	0.66 (0.51, 0.86)	
P value (1 sided)	*P* = .002	
Median PFS, months (95% CI)‡	5.6 (4.3, 7.8)	4.5 (3.0, 5.7)

Number of Patients at Risk:

Sotorasib	171	139	93	63	56	38	30	24	14	6	2	1	0
Docetaxel	174	93	62	36	20	10	7	5	3	1	1	0	

CodeBreaK 200 met its primary endpoint with sotorasib demonstrating superior PFS over docetaxel (HR 0.66, *P* = .002); 12-month PFS rate was 24.8% for sotorasib and 10.1% for docetaxel

*PFS rates estimated using Kaplan-Meier method; ITT population.
†HR and 95% CIs estimated using a stratified Cox proportional hazards model; *P* value calculated using a stratified log-rank test.
‡Medians estimated using Kaplan-Meier method; 95% CIs estimated using the method by Klein and Moeschberger with log-log transformation.

Key Takeaways From 2021–2022 in Lung Cancer

- **Neoadjuvant:** chemo-Nivo superior pCR, MPR, and EFS vs chemo alone in resectable IB–IIIA NSCLC
- **Adjuvant:** post-resection and adjuvant chemo, atezolizumab yields superior DFS in stage II/IIIA, PD-L1–positive NSCLC and potential OS advantage in pts with ≥50% expression. Pembro yields similar PFS benefit in phase III trial
- **LA-NSCLC:** durvalumab post chemo-XRT remains SOC in absence of PD or untoward toxicity
- **PD-L1 ≥50%:** still on the hunt for high-risk features that predict benefit of adding chemo to IO
  - Ongoing research will prospectively define role of chemo-IO vs IO alone
- **Combination CPIs:** hazardous in PS 2, but fit elderly appear to benefit (vs chemo alone)
  - Trials intermixing these populations will lead to “murky” outcomes
- **Second-line treatment:** post–chemo-IO space poses tremendous, unmet need
  - IO + VEGF may be a viable, less-toxic strategy compared with other options in this space (eg, docetaxel ± Ramu)
- ***KRAS* G12C**: adagrasib will likely be the next addition in the therapeutic portfolio
  - Similar to sotorasib in efficacy but has higher grade 3–4 TRAEs that may require dose reduction
  - However, documented CNS penetrance

Paradigms in Cancer Molecular Pathology: 2022

- Histology subtyping of lung cancer is clinically important
- Multiple clinically relevant molecular abnormalities ("driver alterations") have been detected and can be used to direct targeted therapy and improve patients' outcomes
- Liquid biopsy represents an alternative option for molecular testing and potentially early diagnosis
- Immunotherapy-related biomarkers are part of diagnosis (*PD-L1 IHC, microsatellite instability (MSI), and Tumor Mutational Burden (TMB)*. However, additional biomarkers are needed
- As neoadjuvant approaches using immunotherapy and targeted therapy are being adopted, surrogate markers to decide on adjuvant therapy and recurrence such as minimal residual disease are needed
  - Major Pathological Response (MPR)
  - Liquid Biopsy (cfDNA) to assess Minimal Residual Disease (MRD)

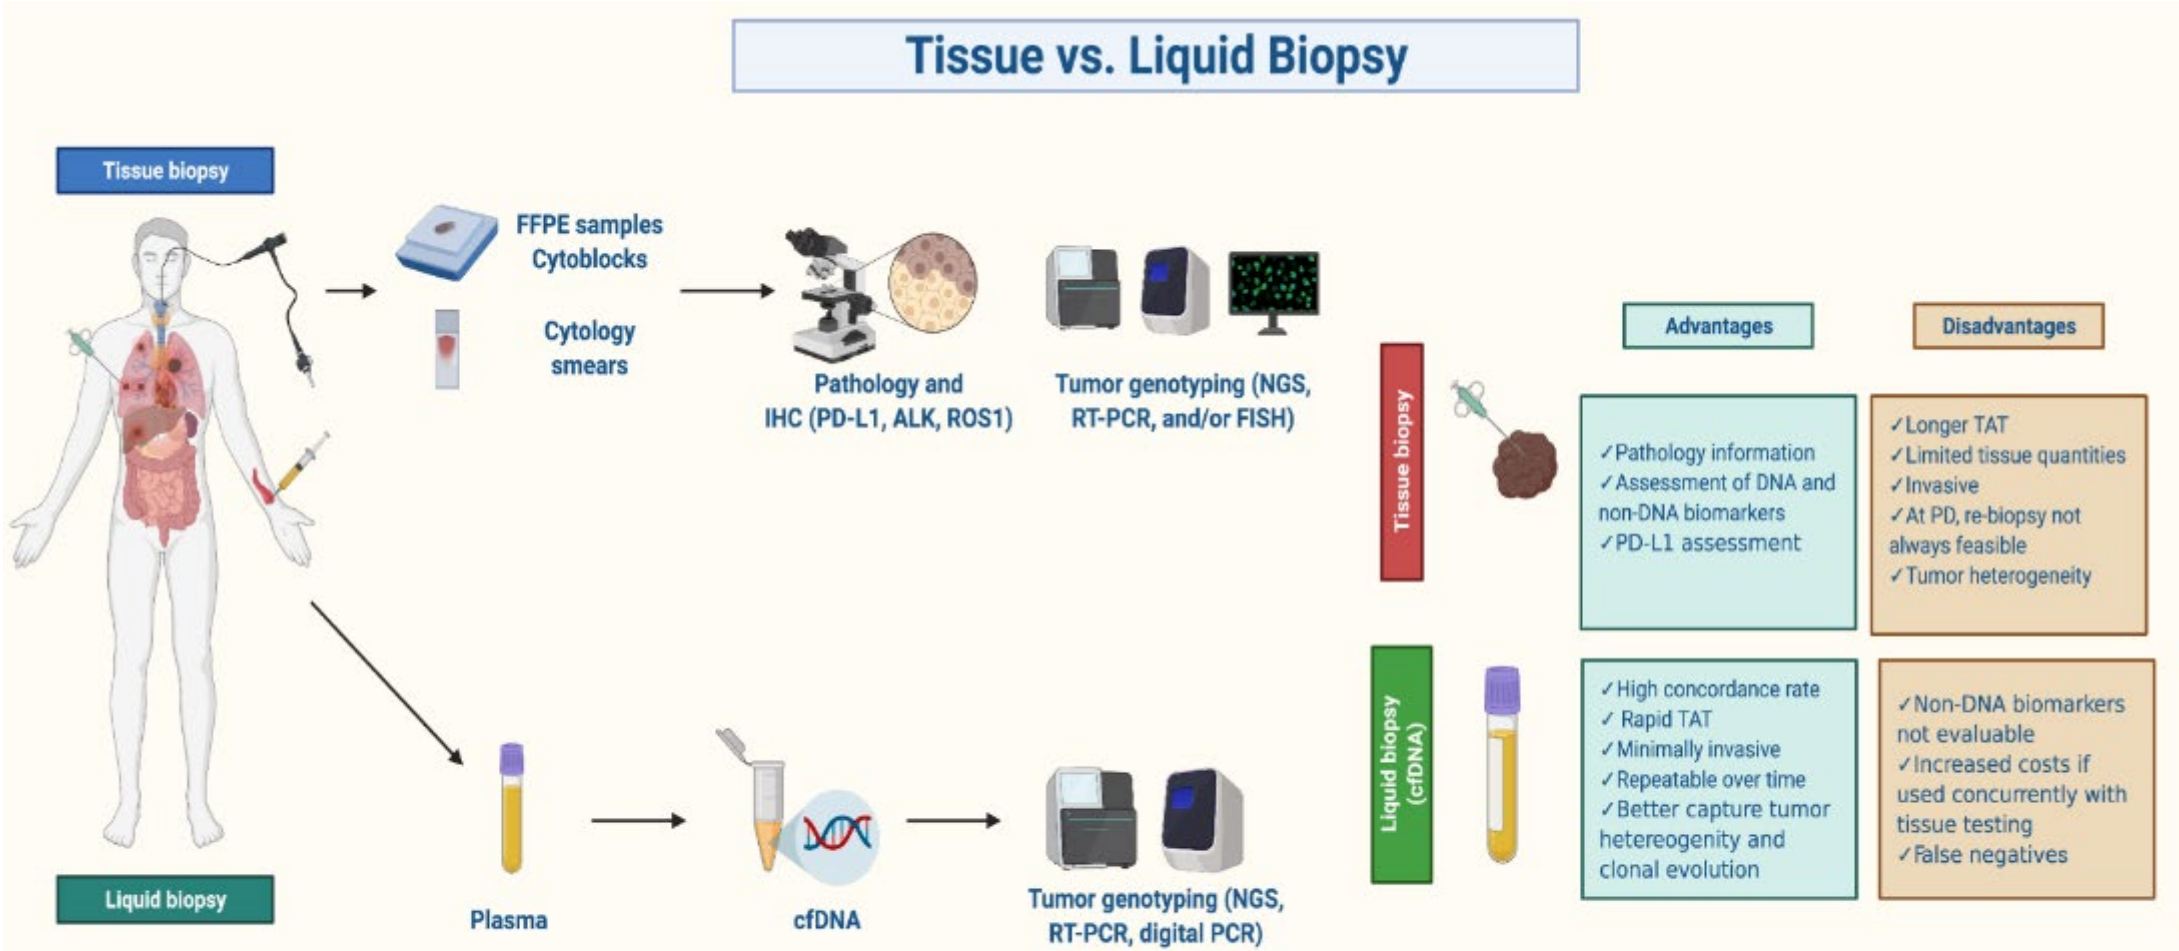
Practical Points for Lung Cancer Molecular Biomarker Testing

- **Type of sample**: tissue, cytology (FNA), blood
- **Choice of platform**: single gene vs multiplex small panel vs multiplex expanded panel
  - Low cost and faster TAT single gene testing such as *ALK* IHC, or *ALK/ROS1* FISH, or real-time PCR for *EGFR*, *BRAF* vs NGS
  - There is a need for more than 1 algorithm for testing depending on practice setting and availability of testing platforms
- **Issues specific to type of practice**
  - Large academic centers vs community-based practice
  - In-house testing vs send out reference lab testing
  - Proposed algorithm that can be adopted in various practice settings
  - Availability of reflex testing
- **Stage of the disease in NSCLC**

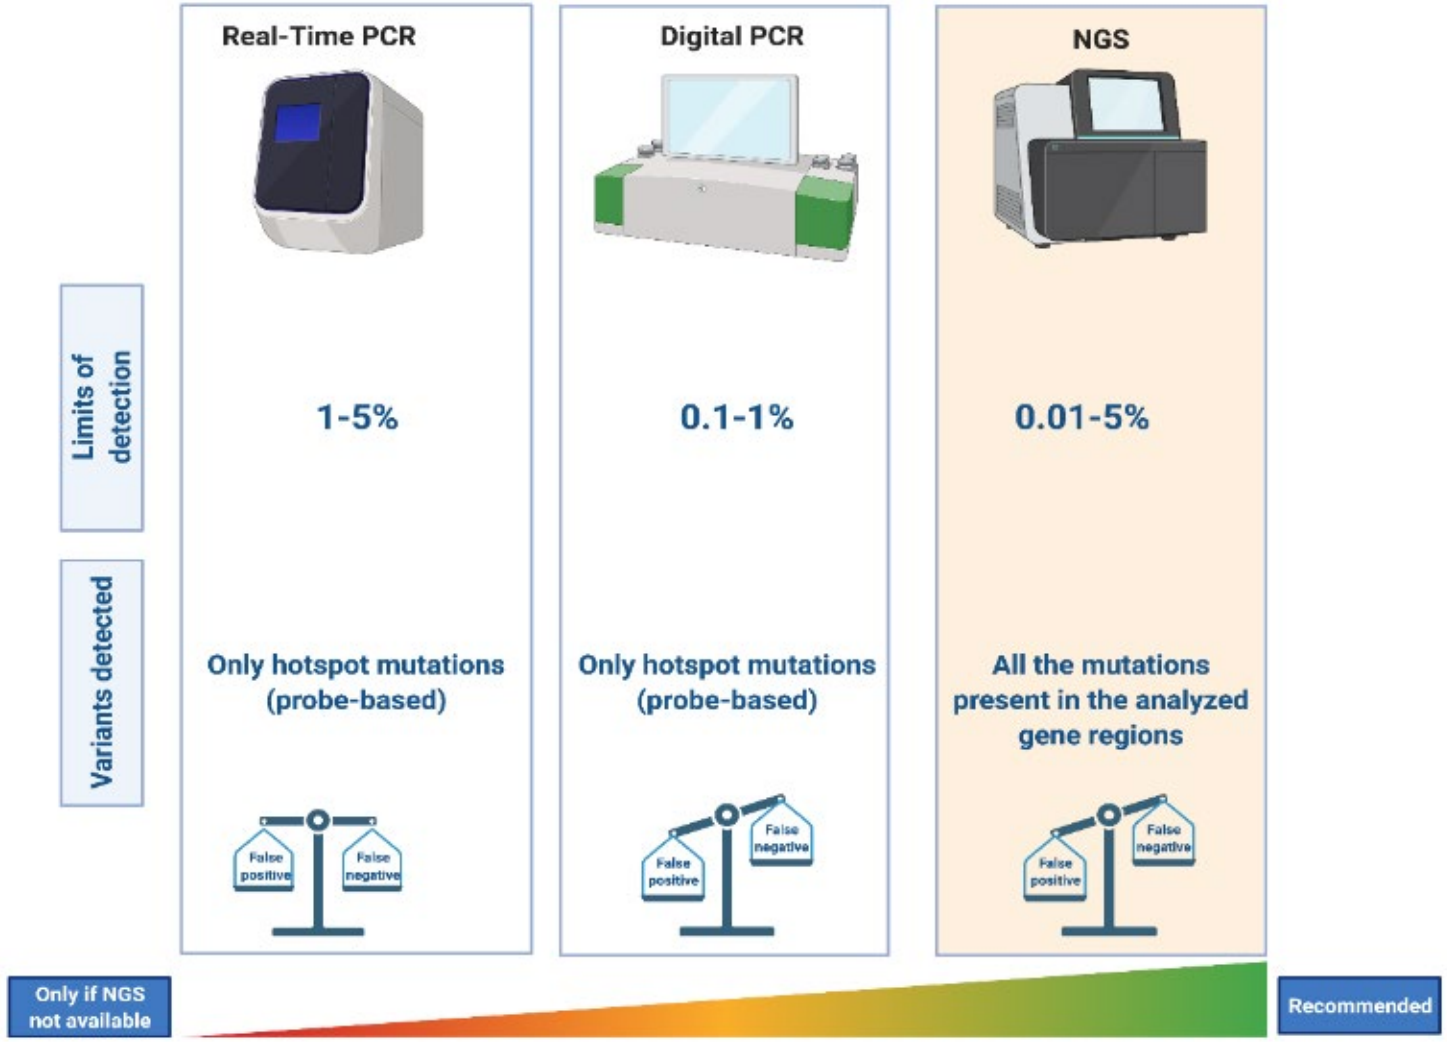
Tissue vs Liquid Biopsy for Molecular Profiling



Cancer

Rolfo C, et al. *J Thorac Oncol*. 2021;16:1647-1662.

Next-Generation Sequencing Panels Major Benefits



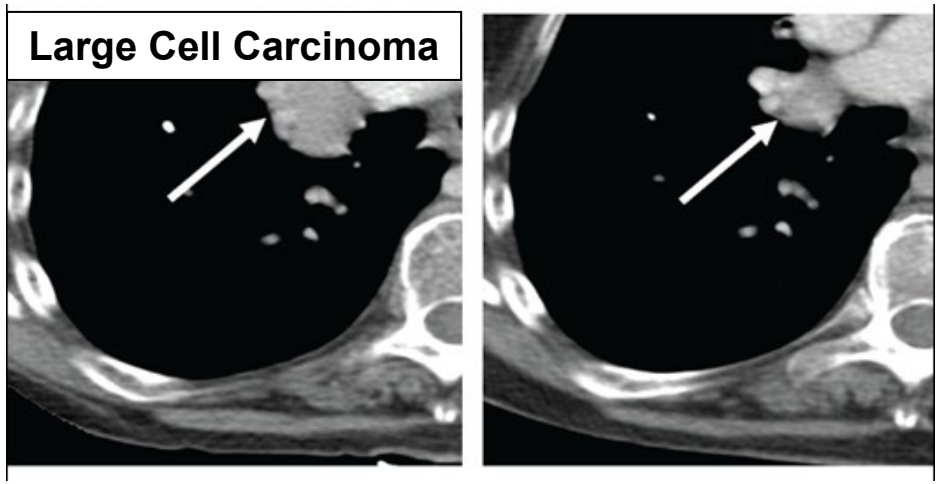
Rolfo C, et al. Unpublished. 2021.

Next-Generation Sequencing Panels Major Benefits

- Provide information in multiple targetable gene abnormalities
- Provide data on mutation, copy number variations, indels, and translocations
- Can be performed in routine, small FFPE tissue samples and liquid biopsy (cfDNA, CTCs, exosome DNA)
- Turnaround time acceptable for clinical management and costs being significantly reduced
- Clinically, they offers to patients more options to get off-label treatment and enter in genomic-based clinical trials
- May provide information on tumor mutational burden (TMB) and immune-suppressive genotypes (eg, *LKB1* mutations)

Benefits of NGS Panels in Lung Cancer

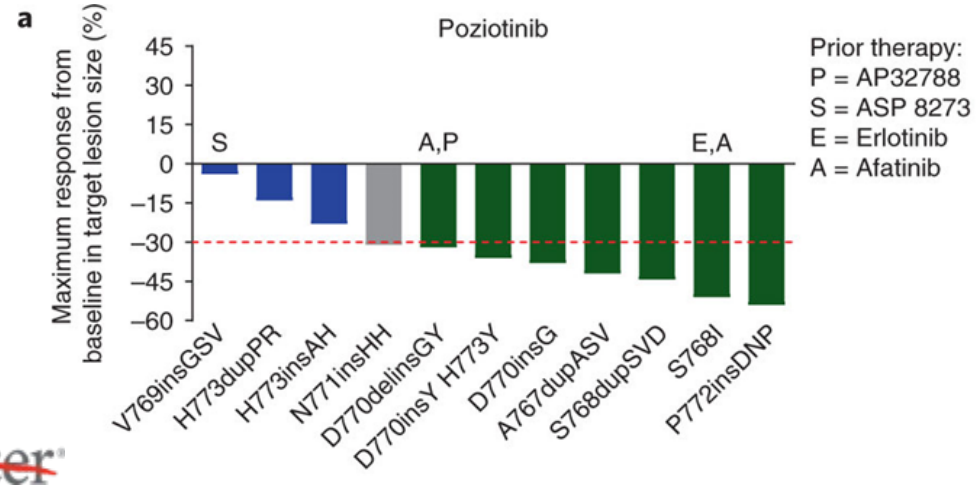
Standard of Care: Treatment with MET inhibitor



- MET exon 14 (*METex14*) is a recurrent somatic splice site
- 0.6% of 38,028 tumors sequenced by FM (3% lung adenocarcinomas)
- Patients' tumor sensitive to MET inhibitor, Capmatinib

Frampton GM, et al. *Cancer Discov.* 2015;5:850-859.

Clinical Research: Treatment with Poziotinib



- *EGFR* exon 20 mutations, resistance to TKIs
- Poziotinib, potential active drug against *EGFR* and *HER2* exon 20 mutations
- Study on 11 patients showed objective partial responses in 7 and stable disease in 3

Robichaux JP, et al. *Nat Med.* 2018;24:638-646.

KRAS^{G12C} Inhibition in Advanced NSCLC

- Phase II trial using a KRAS^{G12C} inhibitor (Sotorasib) in 126 patients, *G12C*-mutated advanced NSCLC previously treated with standard therapies
- Objective response was 37.1, including in 4 (3.2%) who had a complete response and in 42 (33.9%) who had a partial response
- Disease control occurred in 100 patients (80.6%)
- Responses were observed in subgroups defined according to PD-L1 expression, tumor mutational burden, and co-occurring mutations in *STK11*, *KEAP1*, or *TP53*

Moving Beyond PD-L1 as a Biomarker for Guiding Immunotherapy

- **Immune Response**
  - Expression of new immune checkpoint targets (IHC and multiplex approaches)
  - Immune cell infiltrates (IHC and multiplex approaches)
  - Gene expression signatures (mRNA assays)

- **Genomic**
  - Microsatellite instability (MSI) High
  - Tumor Mutational Burden (TMB) for combination immune oncology therapies
  - Genomic predictors of response to therapy
    - *STK1/LKB1* loss
    - Genes involved in inactivation of INF-γ pathway (mechanisms of resistance, *JAK* gene)

Tumor Mutational Burden as a Candidate Predictive Biomarker for Cancer Immunotherapy

- **Somatic mutations in cancers** produce **neoantigens** that induce antitumor immune responses
- **TMB is an emerging predictive biomarker** for cancer checkpoint immunotherapy (CIT)
- TMB can be estimated using whole-exome sequencing (WES) or comprehensive genomic profiling by NGS **(eg, FoundationOne and FACT in blood[bTMB], MSK-IMPACT, Guardant OMNI** in blood)[1-8]
  - Studies show that TMB either by WES or CGP correlate with each other & with efficacy of CPI therapy in multiple cancer types[1-3]
- **Predicted neoantigen load (NAL),** a component of TMB most closely linked to immune response, correlates with F1 TMB & OMNI[4,5,7,8]
- **TMB identifies a distinct patient population** not currently captured by PD-L1 IHC or other immune biomarkers[5,6]

Biomarker Testing in NSCLC

- Regarding liquid biopsy (cfDNA) molecular testing, please select the incorrect option

  a) Detects mutation, deletions, insertions and translocations

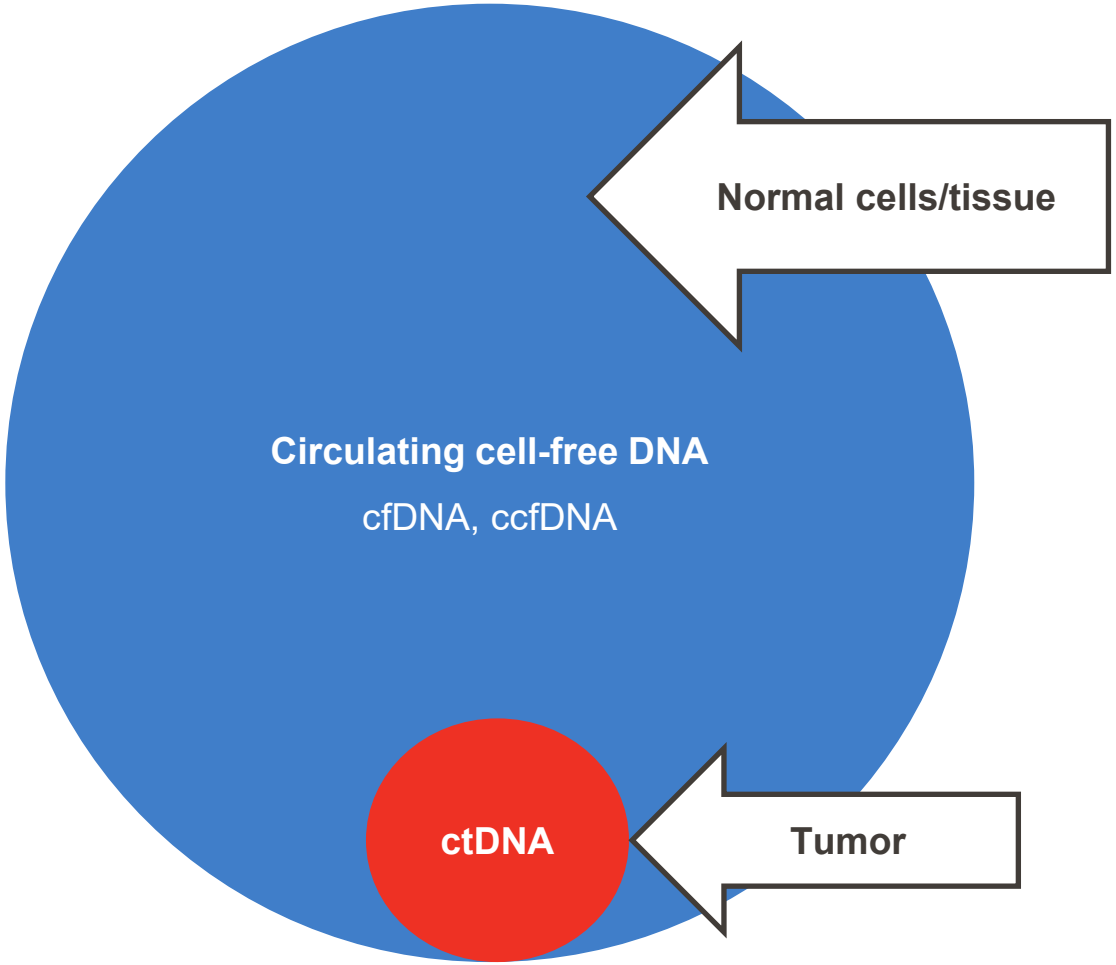
  b) Suitable for NGS panels

  c) Suitable for digital droplet PCR panels

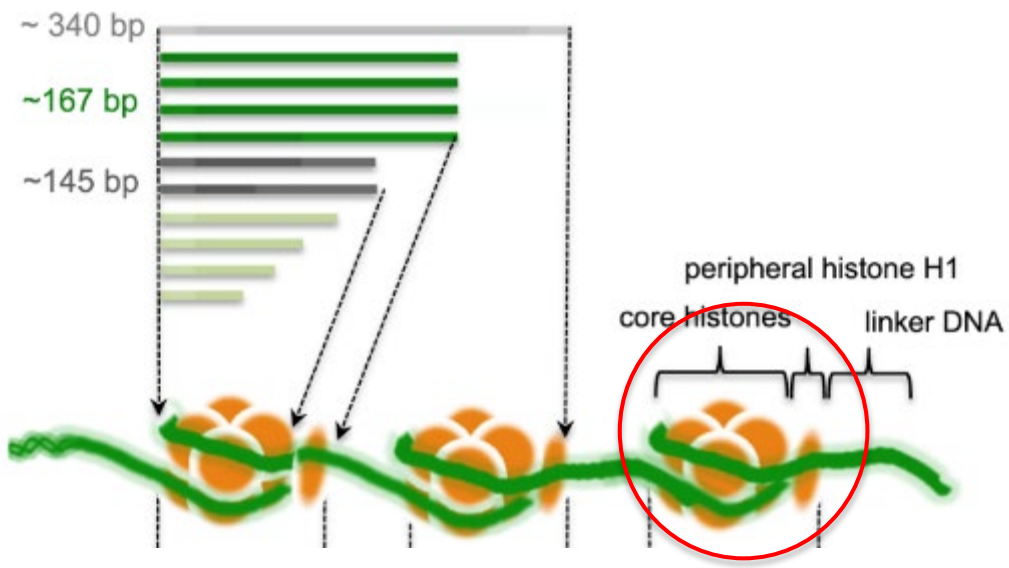
  d) Allows assessment of PD-L1 expression

  e) All above options

Characteristics and Terminology for Circulating Tumor DNA (ctDNA)



167 bp fragments of DNA, a nucleosome



The linker DNA between nucleosomes is cleaved leaving 167 bp cell-free DNA fragments (145 bp plus a ~20 bp segment wrapping histone H1). Originally described by Wyllie in 1980.

Liquid Biopsy in Lung Cancer

- **Currently, it is used in metastatic disease to deliver targeted therapy**
  - Can be easily repeated to control treatment efficiency and/or the detection of genomic changes resulting from resistance to therapy (eg, *EGFR T790M*)
  - It is an alternative to patients with solid tumors when biopsies are inaccessible or after more than one attempt the yield was unsatisfactory
- **Other applications**
  - Tumor mutational burden
  - Monitoring response to immunotherapies
  - Minimal residual disease
  - Early detection

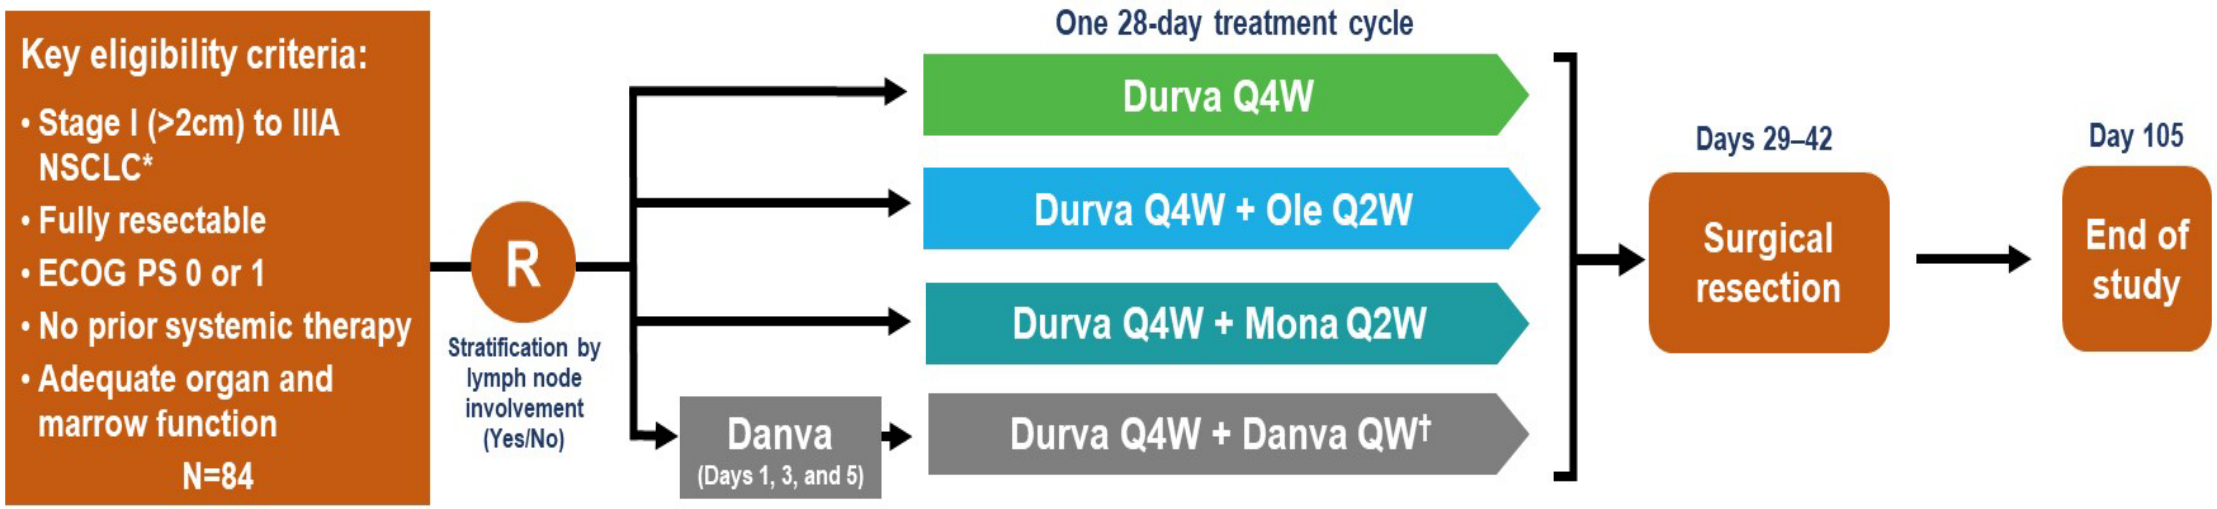
NeoCOAST: Study design and objectives



Endpoints:

- **Primary**: MPR rate (proportion of patients with ≤10% residual viable tumor cells in resected tumor specimen and sampled nodes at surgery) per investigator assessment.
- **Secondary**: pCR rate (no viable tumor cells in resected tumor specimen or sampled nodes at surgery), safety and tolerability, feasibility of planned surgery, pharmacokinetics, and immunogenicity.
- **Exploratory**: Tumor, blood, and stool microbiome biomarkers; investigator-assessed best overall response and ORR (per RECIST v1.1).

Cascone T, et al. AACR 2022. Abstract CT011.

NeoCOAST: Efficacy outcomes in the ITT population

	Durva (n=27)	Durva + Ole (n=21)	Durva + Mona (n=20)	Durva + Danva (n=16)
Pathologic responses				
MPR, n (%)	**3 (11.1)**	**4 (19.0)**	**6 (30.0)**	**5 (31.3)**
pCR, n (%)	1 (3.7)	2 (9.5)	2 (10.0)	2 (12.5)
Responses by RECIST v1.1				
ORR, n (%)	2 (7.4)	1 (4.8)	3 (15.0)	1 (6.3)
Objective responses, n (%)				
PR	2 (7.4)	1 (4.8)	3 (15.0)	1 (6.3)
SD	22 (81.5)	17 (81.0)	15 (75.0)	14 (87.5)
PD	1 (3.7)	3 (14.3)	1 (5.0)	1 (6.3)
NE	1 (3.7)	0	1 (5.0)	0

MPR and pCR rates in the durva arm were similar to published data for anti-PD-1/PD-L1 antibodies (MPR, 6.7–45%; pCR, 0–16.2%).[1–8]

Numerically higher MPR rates were observed across all combination arms, compared with a single dose of durva monotherapy.

No differences in pCR rates were observed between treatment arms.

No significant differences in ORR rates were observed between treatment arms.

NADIM Trial

Neoadjuvant chemotherapy and nivolumab in resectable non-small-cell lung cancer (NADIM): an open-label, multicentre, single-arm, phase 2 trial

Mariano Provencio, Ernest Nadal, Amelia Insa, María Rosario García-Campelo, Joaquín Casal-Rubio, Manuel Dómine, Margarita Majem, Delvys Rodríguez-Abreu, Alex Martínez-Martí, Javier De Castro Carpeño, Manuel Cobo, Guillermo López Vivanco, Edel Del Barco, Reyes Bernabé Caro, Nuria Viñolas, Isidoro Barneto Aranda, Santiago Viteri, Eva Pereira, Ana Royuela, Marta Casarrubios, Clara Salas Antón, Edwin R Parra, Ignacio Wistuba, Virginia Calvo, Raquel Laza-Briviesca, Atocha Romero, Bartomeu Massuti, Alberto Cruz-Bermúdez

Summary

Background Non-small-cell lung cancer (NSCLC) is terminal in most patients with locally advanced stage disease. We aimed to assess the antitumour activity and safety of neoadjuvant chemoimmunotherapy for resectable stage IIIA NSCLC.

Methods This was an open-label, multicentre, single-arm phase 2 trial done at 18 hospitals in Spain. Eligible patients were aged 18 years or older with histologically or cytologically documented treatment-naive American Joint Committee on Cancer-defined stage IIIA NSCLC that was deemed locally to be surgically resectable by a multidisciplinary clinical team, and an Eastern Cooperative Oncology Group performance status of 0 or 1. Patients received neoadjuvant treatment with intravenous paclitaxel (200 mg/m²) and carboplatin (area under curve 6; 6 mg/mL per min) plus nivolumab (360 mg) on day 1 of each 21-day cycle, for three cycles before surgical resection, followed by adjuvant intravenous nivolumab monotherapy for 1 year (240 mg every 2 weeks for 4 months, followed by 480 mg every 4 weeks for 8 months). The primary endpoint was progression-free survival at 24 months, assessed in the modified intention-to-treat population, which included all patients who received neoadjuvant treatment, and in the per-protocol population, which included all patients who had tumour resection and received at least one cycle of adjuvant treatment. Safety was assessed in the modified intention-to-treat population. This study is registered with ClinicalTrials.gov, NCT03081689, and is ongoing but no longer recruiting patients.

Findings Between April 26, 2017, and Aug 25, 2018, we screened 51 patients for eligibility, of whom 46 patients were enrolled and received neoadjuvant treatment. At the time of data cutoff (Jan 31, 2020), the median duration of follow-up was 24·0 months (IQR 21·4–28·1) and 35 of 41 patients who had tumour resection were progression free. At 24 months, progression-free survival was 77·1% (95% CI 59·9–87·7). 43 (93%) of 46 patients had treatment-related adverse events during neoadjuvant treatment, and 14 (30%) had treatment-related adverse events of grade 3 or worse; however, none of the adverse events were associated with surgery delays or deaths. The most common grade 3 or worse treatment-related adverse events were increased lipase (three [7%]) and febrile neutropenia (three [7%]).

Interpretation Our results support the addition of neoadjuvant nivolumab to platinum-based chemotherapy in patients with resectable stage IIIA NSCLC. Neoadjuvant chemoimmunotherapy could change the perception of locally advanced lung cancer as a potentially lethal disease to one that is curable.

PURPOSE Neoadjuvant chemotherapy plus nivolumab has been shown to be effective in resectable non–small-cell lung cancer (NSCLC) in the NADIM trial (ClinicalTrials.gov identifier: NCT03081689). The 3-year overall survival (OS) and circulating tumor DNA (ctDNA) analysis have not been reported.

METHODS This was an open-label, multicenter, single-arm, phase II trial in which patients with stage IIIA NSCLC, who were deemed to be surgically resectable, were treated with neoadjuvant paclitaxel (200 mg/m² once a day) and carboplatin (area under curve 6) plus nivolumab (360 mg) once on day 1 of each 21-day cycle, for three cycles, followed by adjuvant nivolumab monotherapy for 1 year (240 mg once every 2 weeks for 4 months, followed by 480 mg once every 4 weeks for 8 months). The 3-year OS and ctDNA analysis were secondary objectives of the trial.

RESULTS OS at 36 months was 81.9% (95% CI, 66.8 to 90.6) in the intention-to-treat population, rising to 91.0% (95% CI, 74.2 to 97.0) in the per-protocol population. Neither tumor mutation burden nor programmed cell death ligand-1 staining was predictive of survival. Conversely, low pretreatment levels of ctDNA were significantly associated with improved progression-free survival and OS (hazard ratio [HR], 0.20; 95% CI, 0.06 to 0.63, and HR, 0.07; 95% CI, 0.01 to 0.39, respectively). Clinical responses according to RECIST v1.1 criteria did not predict survival outcomes. However, undetectable ctDNA levels after neoadjuvant treatment were significantly associated with progression-free survival and OS (HR, 0.26; 95% CI, 0.07 to 0.93, and HR, 0.04; 95% CI, 0.00 to 0.55, respectively). The C-index to predict OS for ctDNA levels after neoadjuvant treatment (0.82) was superior to that of RECIST criteria (0.72).

CONCLUSION The efficacy of neoadjuvant chemotherapy plus nivolumab in resectable NSCLC is supported by 3-year OS. ctDNA levels were significantly associated with OS and outperformed radiologic assessments in the prediction of survival.

- Spain, 18 hospitals (n = 46)
- Single-arm phase II of neoadjuvant Nivo + Carbo-Paclitaxel × 3 and 1-year adjuvant Nivo in IIIA NSCLC resectable patients
- Demonstrated safety and feasibility of chemo-IO strategy in neoadjuvant space
- 36-month OS 81.9%
- Low pretreatment ctDNA and undetectable ctDNA after neoadjuvant treatment predicted for PFS and OS

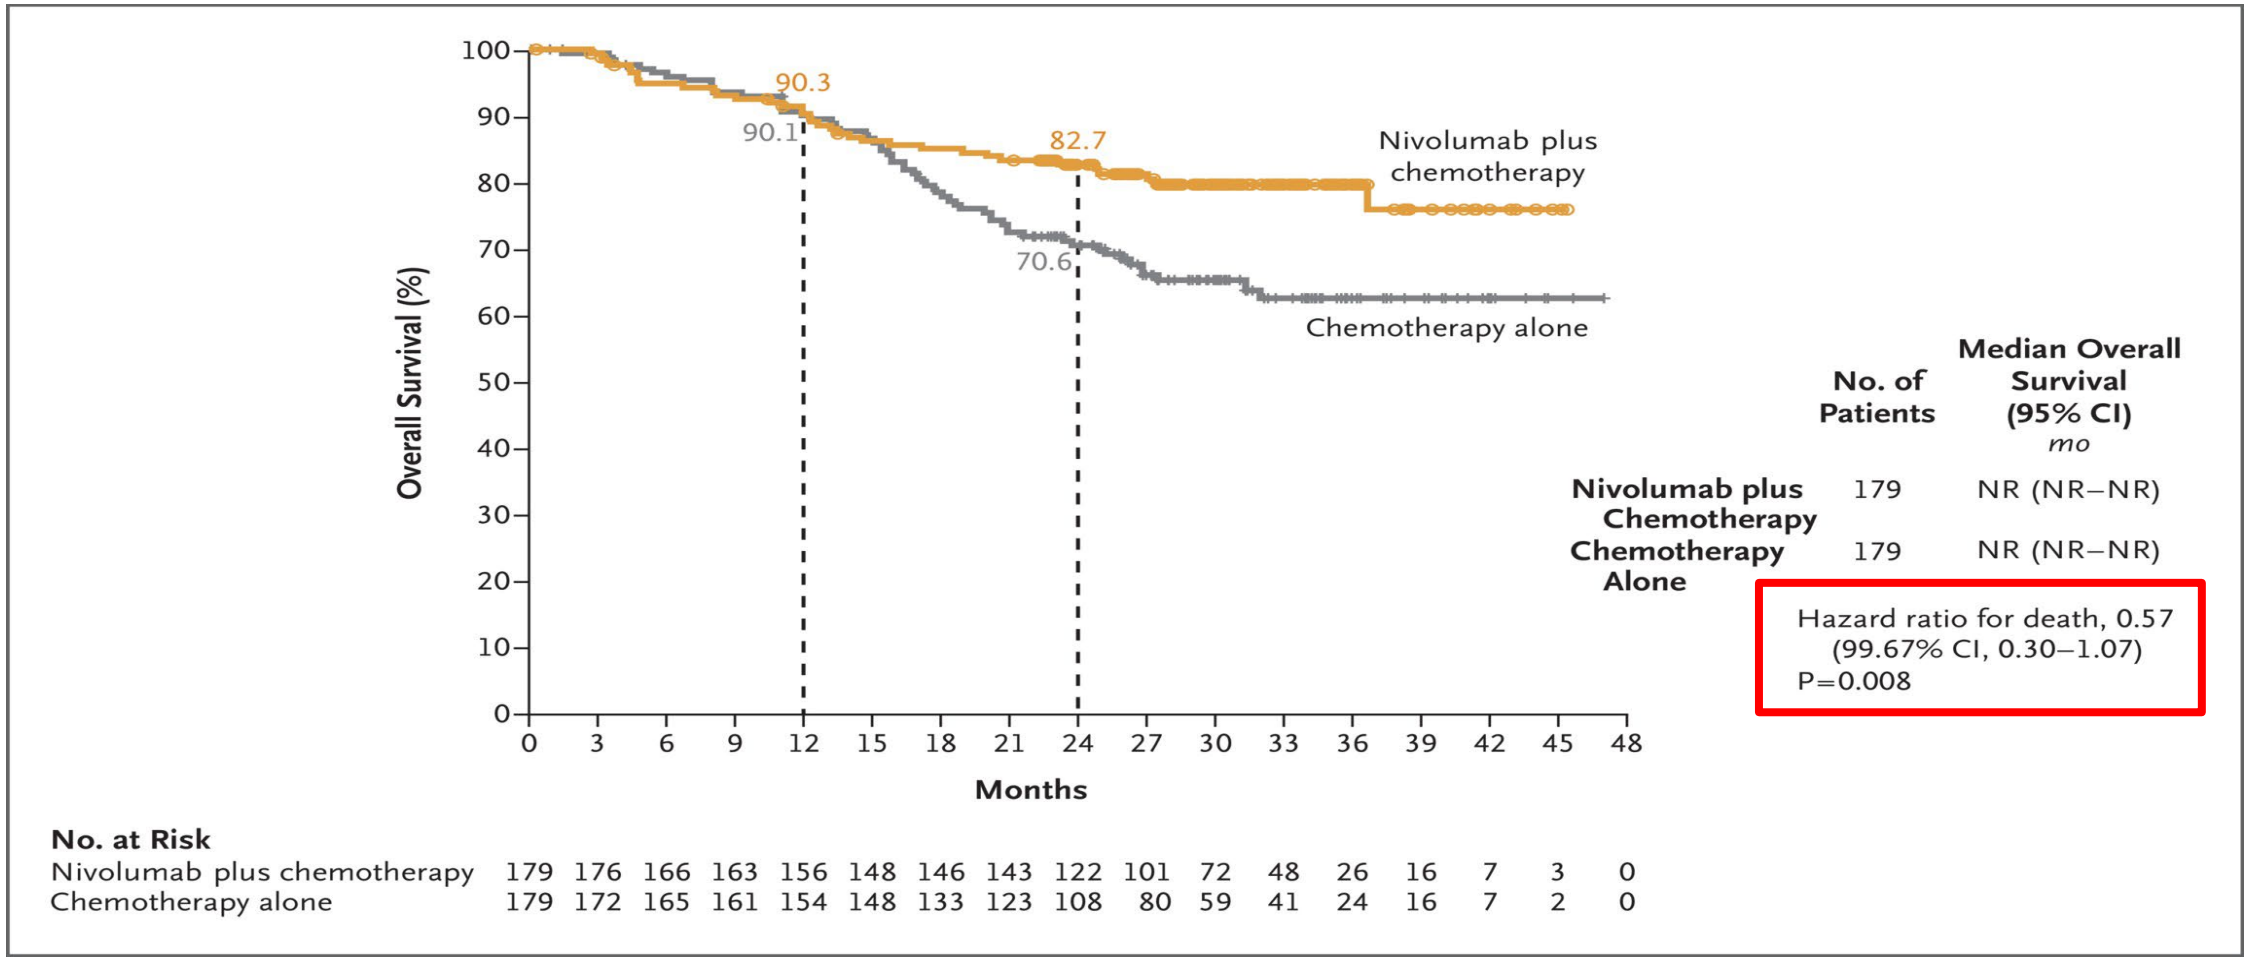
Preliminary Prespecified Interim Analysis: Overall Survival Favors Nivolumab + Chemo



Forde PM, et al. *N Engl J Med.* 2022;386:1973-1985.

Summary Neoadjuvant Chemo + IO

- Consistent data that neoadjuvant chemo + IO improves pCR and response rates
- No new safety signals
- No major impediment to resection
- CheckMate 816 demonstrates EFS benefit
- Neoadjuvant chemo + nivolumab is now a new standard of care

SYSTEMIC THERAPY REGIMENS FOR NEOADJUVANT AND ADJUVANT THERAPY

Preferred (nonsquamous)
- Cisplatin 75 mg/m² day 1, pemetrexed 500 mg/m² day 1 every 21 days for 4 cycles[1]

Preferred (squamous)
- Cisplatin 75 mg/m² day 1, gemcitabine 1250 mg/m² days 1 and 8, every 21 days for 4 cycles[2]
- Cisplatin 75 mg/m² day 1, docetaxel 75 mg/m² day 1 every 21 days for 4 cycles[3]

Other Recommended
- Cisplatin 50 mg/m² days 1 and 8; vinorelbine 25 mg/m² days 1, 8, 15, and 22, every 28 days for 4 cycles[4]
- Cisplatin 100 mg/m² day 1, vinorelbine 30 mg/m² days 1, 8, 15, and 22, every 28 days for 4 cycles[5,6]
- Cisplatin 75–80 mg/m² day 1, vinorelbine 25–30 mg/m² days 1 and 8, every 21 days for 4 cycles
- Cisplatin 100 mg/m² day 1, etoposide 100 mg/m² days 1–3, every 28 days for 4 cycles[5]

Useful in Certain Circumstances
- Chemotherapy Regimens for Patients with Comorbidities or Patients Not Able to Tolerate Cisplatin
- Carboplatin AUC 6 day 1, paclitaxel 200 mg/m² day 1, every 21 days for 4 cycles[7]
- Carboplatin AUC 5 day 1, gemcitabine 1000 mg/m² days 1 and 8, every 21 days for 4 cycles[8]
- Carboplatin AUC 5 day 1, pemetrexed 500 mg/m² day 1 every 21 days for 4 cycles[9] (non-squamous histology)

All chemotherapy regimens listed above can be used for sequential chemotherapy/RT.

Neoadjuvant Systemic Therapy
- Nivolumab 360 mg and platinum-doublet chemotherapy every 3 weeks for 3 cycles[10,*]
  - Platinum-doublet chemotherapy options include:
    - ◊ Carboplatin AUC 5 or AUC 6 day 1, paclitaxel 175 mg/m² or 200 mg/m² day 1 (any histology)
    - ◊ Cisplatin 75 mg/m² day 1, pemetrexed 500 mg/m² day 1 (non-squamous histology)
    - ◊ Cisplatin 75 mg/m² day 1, gemcitabine 1000 mg/m² or 1250 mg/m² days 1 and 8 (squamous histology)
    - ◊ Cisplatin 75 mg/m² day 1, paclitaxel 175 mg/m² or 200 mg/m² day 1 (any histology)
  - Chemotherapy Regimens for Patients with Comorbidities or Patients Not Able to Tolerate Cisplatin
    - ◊ Carboplatin AUC 5 or AUC 6 day 1, pemetrexed 500 mg/m² day 1 (non-squamous histology)
    - ◊ Carboplatin AUC 5 or AUC 6 day 1, gemcitabine 1000 mg/m² or 1250 mg/m² days 1 and 8 (squamous histology)

Neoadjuvant Targeted Therapy Trials

	Population	Study drugs	Treatment duration	Objective response rate	Major pathological response	Pathological complete response	Median disease-free survival (months)	Median overall survival (months)	Grade 3 or above treatment-related adverse events	R0 surgery	Adjuvant treatment
Zhong et al (2019)[23]	Resectable stage IIIA–N2; Ex19del or L858R (n=72)	Erlotinib *vs* gemcitabine plus cisplatin	Erlotinib: 42 days preoperatively followed by 12 months postoperatively; gemcitabine plus cisplatin: 2 cycles preoperatively and 2 cycles postoperatively	54·1%* (20 of 37) with erlotinib *vs* 34·3%* (12 of 35) with gemcitabine plus cisplatin	9·7% (3 of 31) with erlotinib *vs* 0·0% (0 of 23) with gemcitabine plus cisplatin	0·0% with erlotinib *vs* 0·0% with gemcitabine plus cisplatin	21·5 with erlotinib *vs* 11·4 with gemcitabine plus cisplatin	45·8 with erlotinib *vs* 39·2 with gemcitabine plus cisplatin	None with erlotinib; 29·4% (17·6% neutropenia, 2.9% vomiting, 2.9% elevated blood glucose, and 2.9% bone marrow cell reduction) with gemcitabine plus cisplatin	73·0% (27 of 37) with erlotinib; 62·9% (22 of 35) with gemcitabine plus cisplatin	75·7% (28 of 37) with erlotinib; 62·9% (22 of 35) with gemcitabine plus cisplatin
Xiong et al (2019)[43]	Stage IIIA–N2; Ex19del or L858R (n=19)	Erlotinib	56 days	42·1% (8 of 19)	NR	NR	11·2	51·6	15·8% (5·3% abnormal liver function, 5·3% leukopenia, and 5·3% cerebral infarction)	68·4%* (13 of 19)	Most (exact figure NR)
Zhang et al (2021)[44]	Operable stage II–IIIA Ex19del or L858R (n=33)	Gefitinib	42 days	54·5%* (18 of 33)	24·2% (8 of 33)	NR	33·5	Not reached	None	87·9% (29 of 33)	100·0% (29 of 29; platinum doublet chemo-therapy or radiotherapy)
Tan et al (2019)[45]†	Stage IA–IIIA; Ex19del or L858R (n=13)	Gefitinib	Minimum 4 weeks (median 1·4 months)	61·5% (8 of 13)	7·7% (1 of 13)	NR	20·2	NR	8·0% (abnormal liver function test)	100·0% (13 of 13)	NR

R0=resection with negative margins. NR=not reported. *Primary endpoint. †Study available only in abstract form.

- Mostly *EGFR* focused
- EMERGING-CTONG1103
  - PFS benefit
- ALINA (*ALK* rearranged) ongoing
  - NCT03456076
- Currently no standard recommendation for neoadjuvant targeted therapy

Saw SPL, et al. *Lancet Oncol*. 2021;22:e501-e516.

Window of Opportunity Trials With Targeted Therapies

Advantages

- Smaller trial size can be completed with faster outcomes
- Optimal evaluation of a novel targeted agent – opportunity for "pure" results
  - Clean biomarker analysis pre- and post-neoadjuvant targeted agent
  - Ability for clean assessment of peripheral surrogate biomarkers
- Response to the targeted agent can be directly correlated to radiographic and pathologic results
- Can evaluate tumor heterogeneity response to the targeted agent

Disadvantages

- Experienced centers with multidisciplinary and translational programs
- Small sample size needs a greater effect to be significant
- Target of the novel agent should be known
- Must have a reasonable safety profile and tolerability
- Short window of neoadjuvant treatment may require adjuvant maintenance therapy to really see any survival impact
  - Unknown what the optimal duration of adjuvant maintenance
  - Also, unlikely to see significant response rates unless similar in magnitude of effect of *EGFR* mutations to EGFR TKI
  - May requires alternative endpoints

Clinical Conclusions

- Neoadjuvant therapy is an accepted standard practice
- Choice of when to utilize it should be personalized to each individual patient

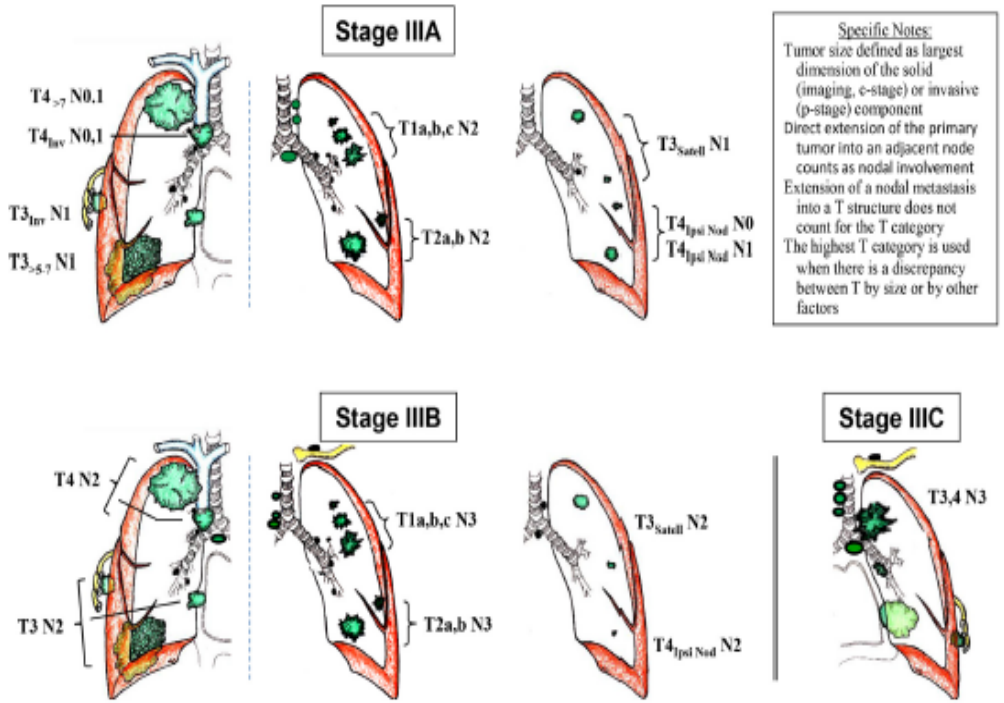

Figure 3 – *Graphic illustration of stage III.*

Hypothetical Future Strategies

Unresectable large T or N3 or bulky or multi-station N2 LN	Neoadjuvant chemoimmunotherapy, concurrent immunoradiation, then 1 year immunotherapy
Small T, **PD-L1 IHC-high,** small multi-station N2 LN	Concurrent immunoradiation, then 1 year immunotherapy
Small T, PD-L1 IHC low, small multi-station N2 LN	Concurrent chemoradiation, then 1 year immunotherapy
Large T single-station N2 LN	Neoadjuvant chemoimmunotherapy, surgery ± XRT, then 1 year immunotherapy
Small T single-station N2 LN	Neoadjuvant immunotherapy, surgery ± XRT, then 1 year immunotherapy

Detterbeck FC, et al. *Chest*. 2017;151:193-203.

Academic Summary

- Window of opportunity neoadjuvant trials are essential to understanding and developing predictive biomarkers
- Trials determining optimal sequence of treatments are needed
  - Which patients only need neoadjuvant? Adjuvant? Or both?
  - What stages should be considered for neoadjuvant? Stage III vs II vs IB
  - What pathologic endpoints can be used as predictive for additional therapy?
  - Who can avoid chemo?
  - Can patients who previously responded to neoadjuvant receive similar regimens when they develop disease recurrence?

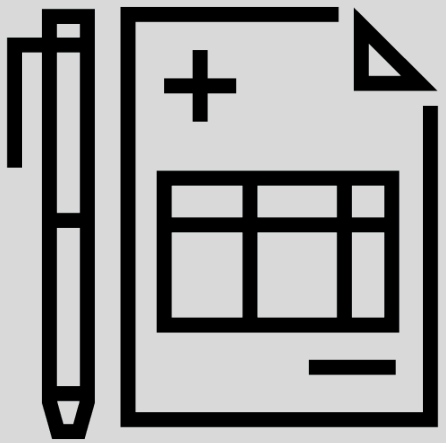
Global Lung Cancer Academy

Debate: Adjuvant vs Neoadjuvant Therapy for NSCLC?

Moderator: Corey Langer, MD

Presenters: Anne Tsao, MD, and Narjust Florez, MD

Patient case



Patient and disease characteristics

- 70-year-old woman
- Former smoker who quit 20 years ago

Diagnosis

- Stage II NSCLC, lymph node positive
- Biopsy shows *P53* mutation positive but no other mutations
- PD-L1 = 15%

What would be your treatment approach for this patient?

- Neoadjuvant therapy
- Adjuvant therapy

Global Lung Cancer Academy

Neoadjuvant Therapy

Anne Tsao, MD

Patient Case Debate

Case for Neoadjuvant Therapy

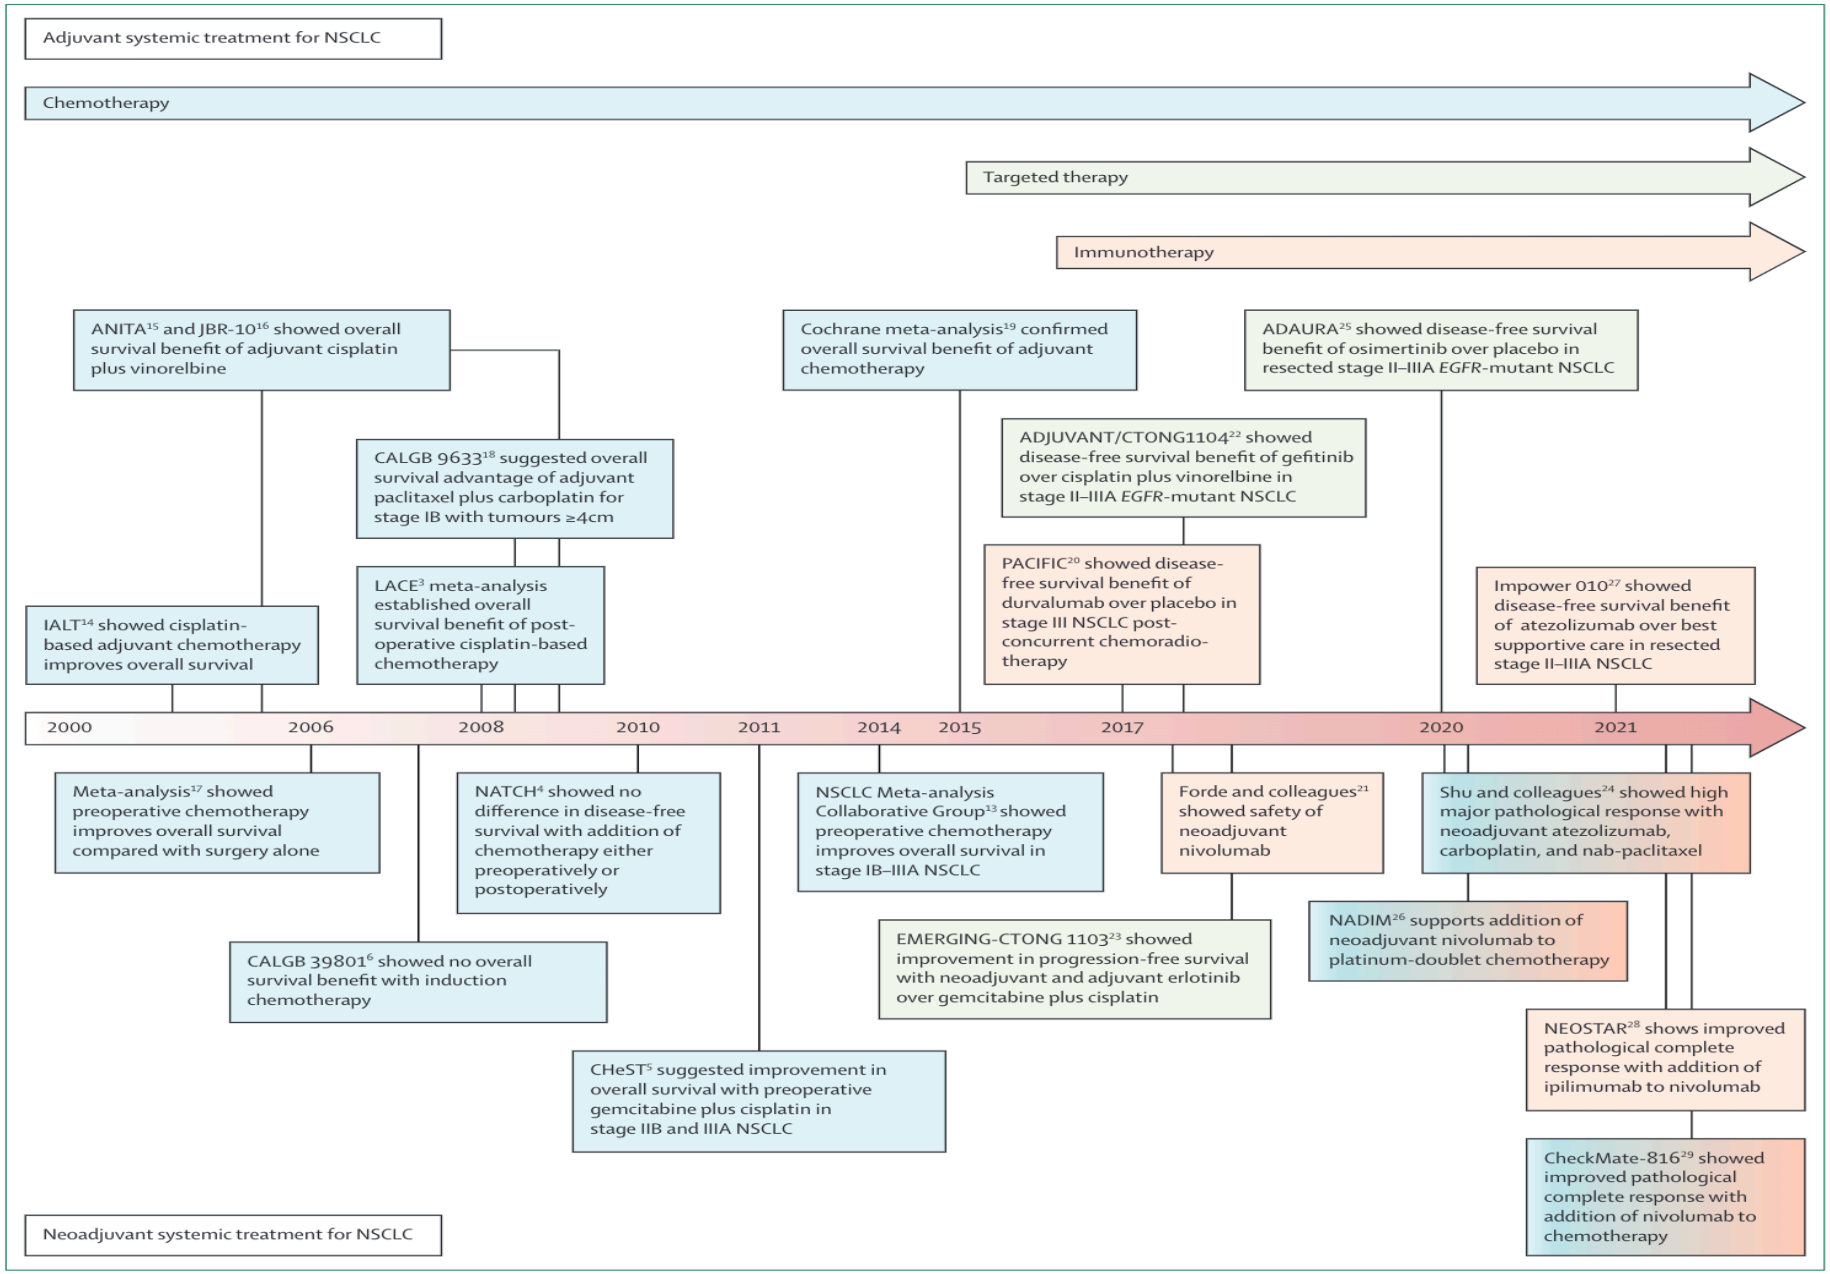


Figure 1: **Timeline of main milestones in adjuvant and neoadjuvant systemic treatment of NSCLC**
NSCLC=non-small-cell lung cancer.

Saw SPL, et al. *Lancet Oncol*. 2021;22:e501-e516.

Neoadjuvant Therapy

ADVANTAGES

- Time to encourage preoperative tobacco abstinence
- Earlier elimination of micrometastatic disease
- Chemotherapy ± IO better tolerated before major surgery than after – higher dose intensity
- Possible downstaging
- Prognostic value – assessment of chemo or chemo-IO sensitivity
- Opportunity for biomarker discovery pretreatment and posttreatment

DISADVANTAGES

- Delay to definitive procedure
- Toxicity of chemotherapy interferes with surgery
- Potential staging ambiguity
- Increased risk of postoperative complications

Prognostic Factors for Improved Survival After Neoadjuvant Therapy

- Response to chemotherapy
- Downstage N2 disease
- Single-station N2 is better than multi-station N2 disease
- R0 resection
- Pathologic CR
- Better systemic therapies may lead to improved downstaging and clinical outcomes
- Personalized therapy with targeted agents and molecular profiling
- Window of opportunity trials

Phase III Adjuvant Immunotherapy Trials

IMpower010[1,2]

Stratified by PD-L1 expression, sex, stage (IB vs II vs IIIA, and histology

Adults with stage IB (T ≥4 cm)/II/IIIA NSCLC per *AJCC* 7th ed. after complete surgical resection (N = 1280)

→ **Cisplatin + pemetrexed, gemcitabine, docetaxel, or vinorelbine** 1–4 cycles

- → **Atezolizumab** 1200 mg IV Q3W × 16
- → **BSC** × 1 yr

Chemotherapy mandatory

- **Primary endpoint:** DFS by investigator (hierarchical design) in PD-L1+ stage II–IIIA > all stage II–IIIA > ITT (stage IB–IIIA)

PEARLS/KEYNOTE-091[3]

Stratified by disease stage (IB vs II vs IIA), PD-L1 TPS (<1% vs 1%–49% vs ≥50%, and geographic region

Adults with stage IB (T ≥4 cm)/II/IIIA NSCLC per *AJCC* 7th ed. after complete surgical resection with provision of tumor tissue for PD-L1 testing (N = 1177)

- → **Pembrolizumab** 200 mg IV Q3W × 1 yr
- → **Placebo** IV Q3W × 1 yr

Chemotherapy not mandatory

- **Primary endpoint:** DFS

Cross-trial comparisons have significant limitations. The information in this section is presented in order to generate discussion, not to make direct comparisons between study results.

IMpower010: Safety

IASLC 2022 World Conference on Lung Cancer
AUGUST 6-9, 2022
VIENNA, AUSTRIA

	Median Follow-up: 32 Mo	Median Follow-up: 46 Mo	
Safety Event, %	**Atezolizumab (n = 495)**	**Atezolizumab (n = 495)**	**BSC (n = 495)**
Any-grade AE	92.7	92.5	70.9
▪ Treatment related	67.7	67.9	0
Grade 3/4 AEs	21.8	22.0	11.5
▪ Treatment related	10.7	10.7	0
Serious AEs	17.6	17.8	8.5
▪ Treatment related	7.5	7.5	0
Grade 5 AEs	1.6	1.8*	0.6
▪ Treatment related	0.8	0.8	0
AE leading to atezolizumab dose interruption	28.7	28.7	0
AE leading to any treatment discontinuation	18.2	18.2	0
Atezolizumab-related AEs of interest	51.7	52.1	9.5
▪ Grade 3/4	7.9	7.9	0.6
▪ Requiring use of systemic corticosteroids	12.1	12.3	0.8

*No new deaths occurred between median follow-up of 32 mo and 46 mo, but 1 “other” death was updated to grade 5 AE.

IMpower010: Conclusions

- Trend toward OS benefit in patients with stage II–IIIA NSCLC with PD-L1 TC ≥1% vs BSC
  - OS HR: 0.71 (95% CI: 0.49–1.03) in this patient population
  - Trend toward OS benefit also seen in patients with stage II–IIIA NSCLC with PD-L1 TC ≥50%; OS HR: 0.43 (95% CI: 0.24–0.78)
- Safety profile of adjuvant atezolizumab at median follow-up of 46 mo similar to earlier data
- Investigators concluded that these data continue to support previous findings and currently approved use of atezolizumab as adjuvant treatment for patients with stage II–IIIA NSCLC who are PD-L1 positive after complete resection and adjuvant chemotherapy
  - Additional follow-up required for final DFS analysis and subsequent hierarchical OS analysis

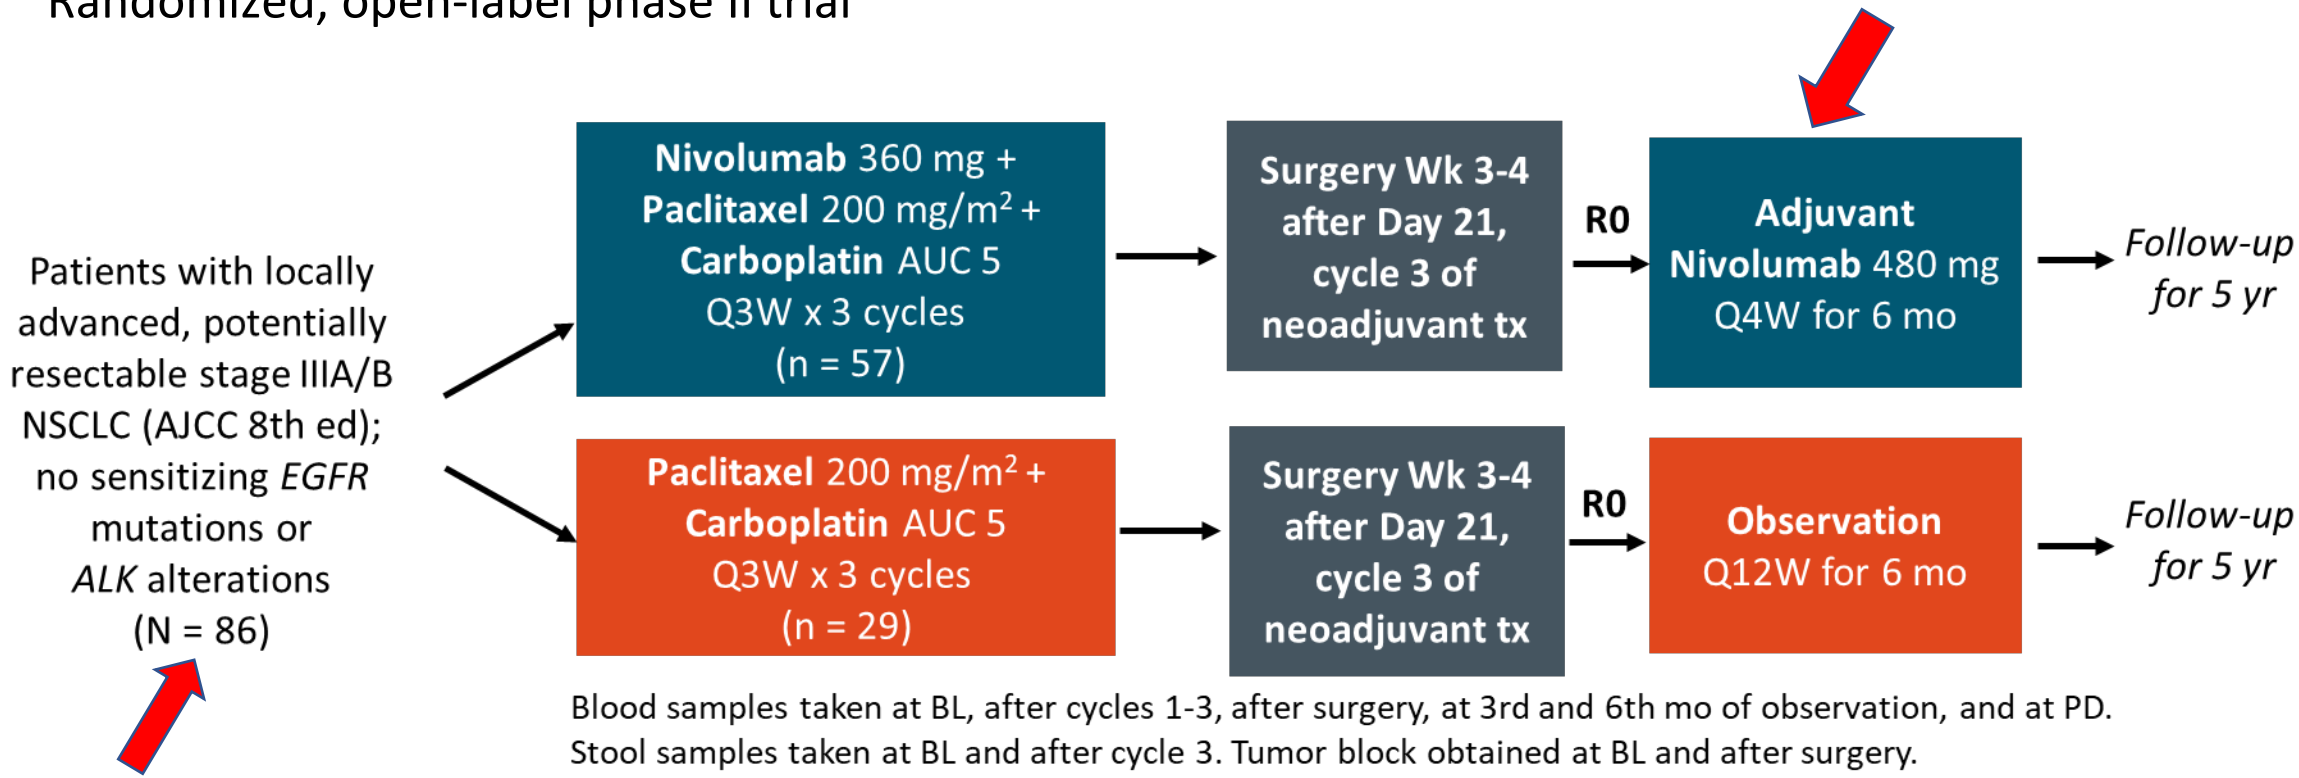
PRO Adjuvant Immunotherapy in Lung Cancer

- Provides the opportunity to treat patients after they already had surgery
- Potential lower percentage of delays to surgery (curative treatment)
- Patients may feel more comfortable receiving therapy after surgery (as well as surgeons)
- Available OS for patients with PD-L1 >50%
- The story for other patients is still developing for IMpower010

What About NADIM II?

- Randomized, open-label phase II trial



Blood samples taken at BL, after cycles 1-3, after surgery, at 3rd and 6th mo of observation, and at PD. Stool samples taken at BL and after cycle 3. Tumor block obtained at BL and after surgery.

Clinical case.

67-year-old female presented with SOB and cough to ER. CXR revealed an opacification in the right mediastinum. CT chest w contrast revealed a RUL lesion 2.5 cm and bulky lymphadenopathy (4 cm) in the R mediastinum and 2.1cm LN in the subcarinal. Patient underwent bronchoscopy and tissue confirm the presence of adenocarcinoma at subcarinal level; PET CT scan revealed no metastatic disease (cT1cN2M0, stage IIIA). ECOG PS 0. Co-morbid conditions: HTN and hyperlipidemia. TMP revealed EGFR(-), ALK (-), and PD-L1 80%.

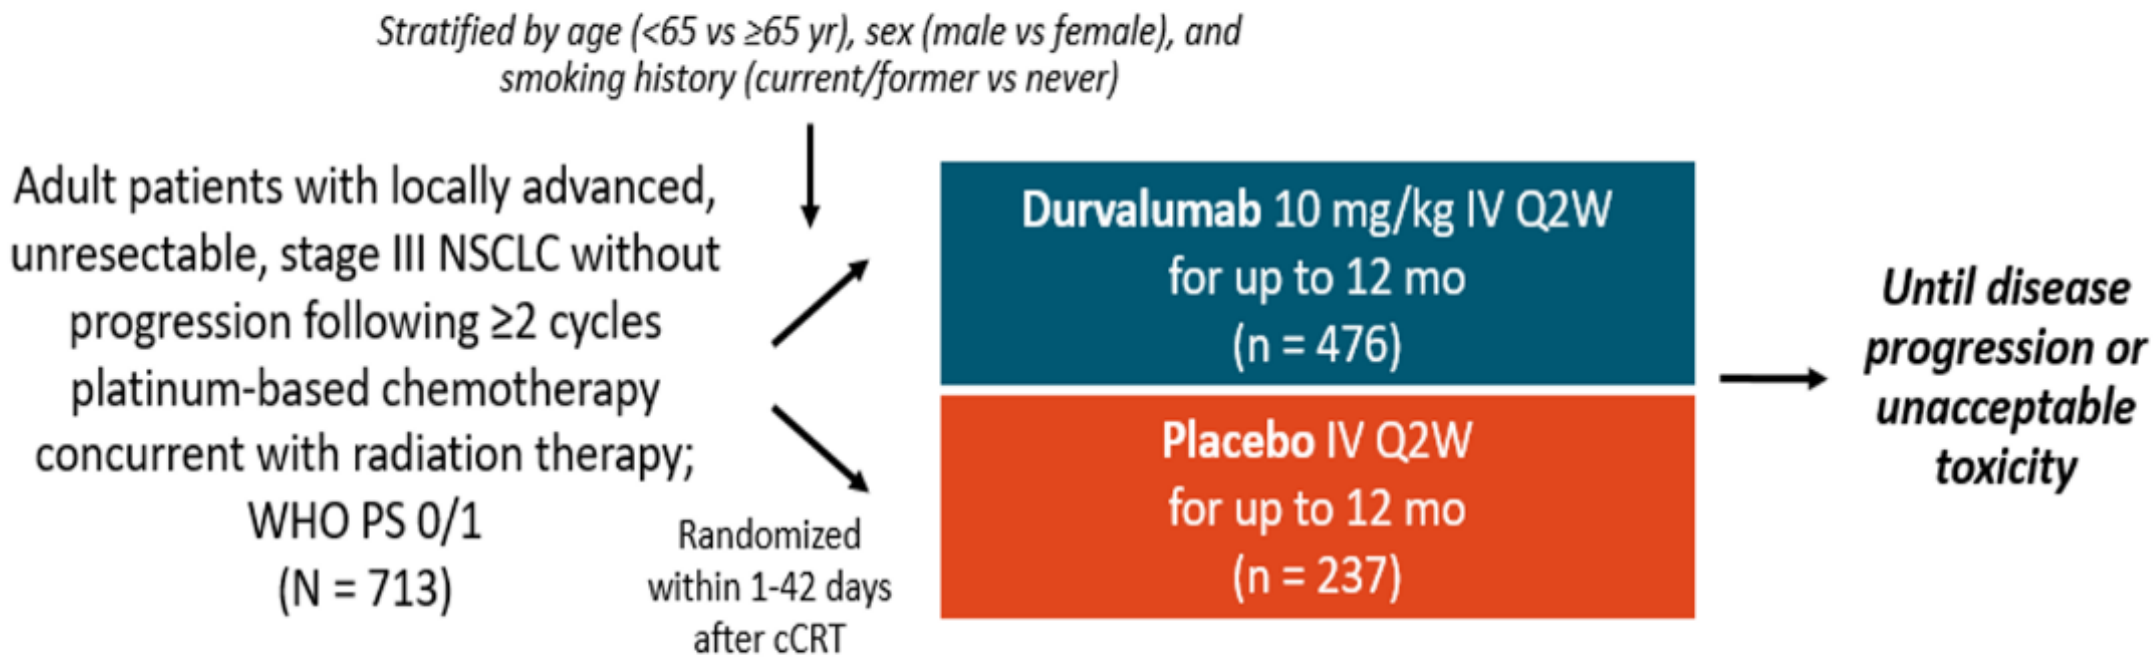
All the following therapeutic approaches may be acceptable except:

1. Neoadjuvant nivolumab plus chemotherapy followed by surgery.
2. cCRT followed by Durvalumab
3. Single agent immunotherapy
4. Sequential chemotherapy followed by cCRT followed by durvalumab.

Background.....

PACIFIC Trial

- Randomized, double-blind, placebo-controlled phase III trial



Patients enrolled regardless of PD-L1 status. If available, pre-cCRT tumor tissue archived for PD-L1 testing.

PACIFIC into Perspective….

	Albain	RTOG 0617	PACIFIC	PACIFIC
Arm	CCRT→Resection	CCRT (60 Gy)	CCRT	CCRT→durva
Median follow up	1.88 yrs	5.1 yrs	5.0 yrs	5.0 yrs
OS (median)	23.6 mos	28.7 mos	29.1 mos	47.5 mos
5-year OS	NR	32.1%	33.4%	42.9%
5-year PFS	22%	23%	19%	33.1%

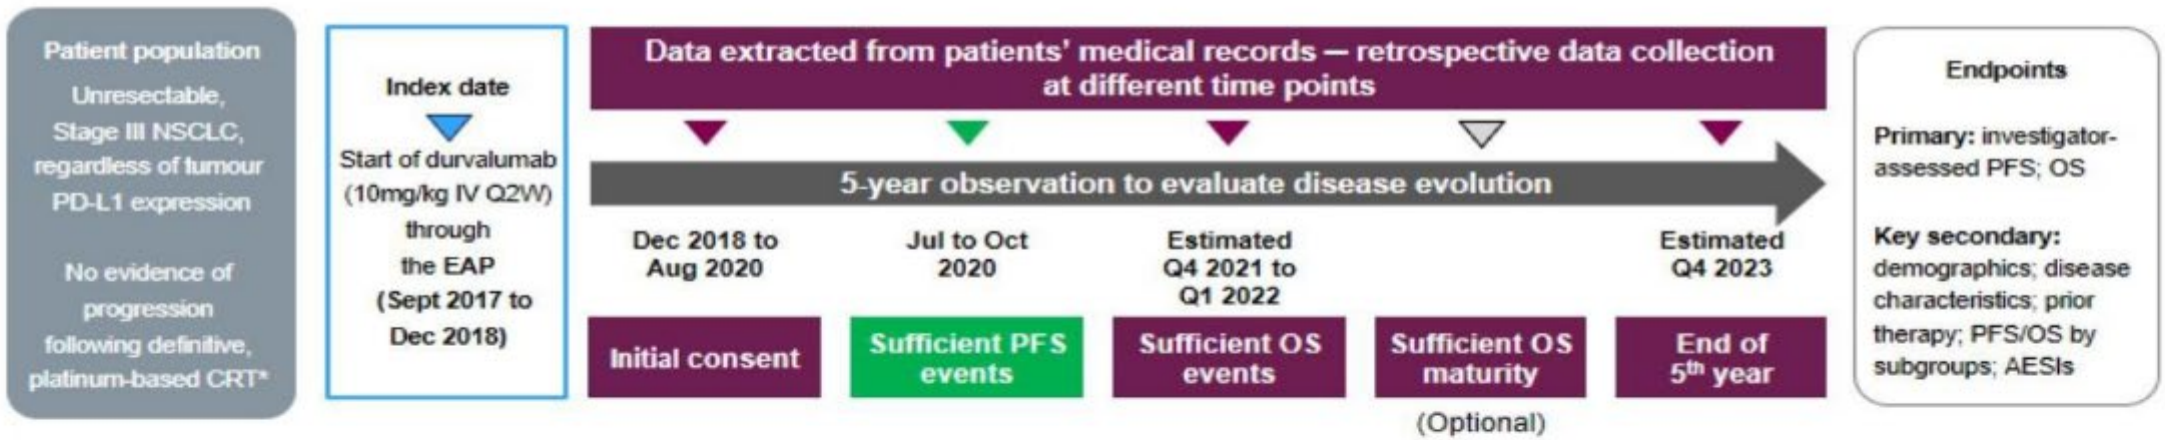
PACIFIC: Summary

- Durvalumab demonstrated improvements in PFS and OS versus placebo.
- Patients who received durvalumab had a lower incidence of new lesions including brain metastases compared with placebo.
- No new safety signals were identified.
- For patients with unresectable Stage III NSCLC who have not progressed post 2 cycles of definitive chemoradiation, durvalumab is FDA approved and category 1 on NCCN.

PACIFIC Real-World Study: ESMO 2021

Study Design & Status (NCT03798535)

PACIFIC-R: An International, Observational Study



- **1,399 patients** included in the **full analysis set (FAS)** from **290 active sites** in **11 participating countries**
  - France (n=342), Spain (244)†, Australia (165), Netherlands (155), Belgium (118), Italy (116), Israel (92), Germany (62), UK (54), Norway (36), and Switzerland (15)

*Patients had completed platinum-based chemotherapy concurrent or sequential to radiotherapy within the previous 12 weeks without evidence of disease progression; †Spanish data are from an externally sponsored study integrated in April 2021
AESI, adverse event of special interest; CRT, chemoradiotherapy; EAP, expanded access programme; IV, intravenously; NSCLC, non-small-cell lung cancer; OS, overall survival; PD-L1, programmed cell death-ligand 1; PFS, progression-free survival; Q2W, every 2 weeks

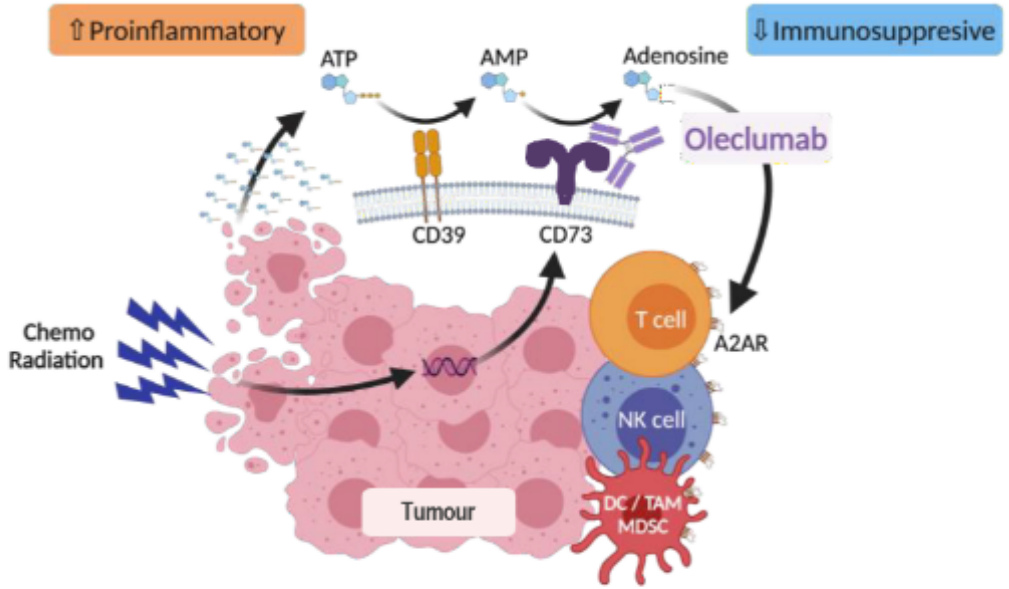
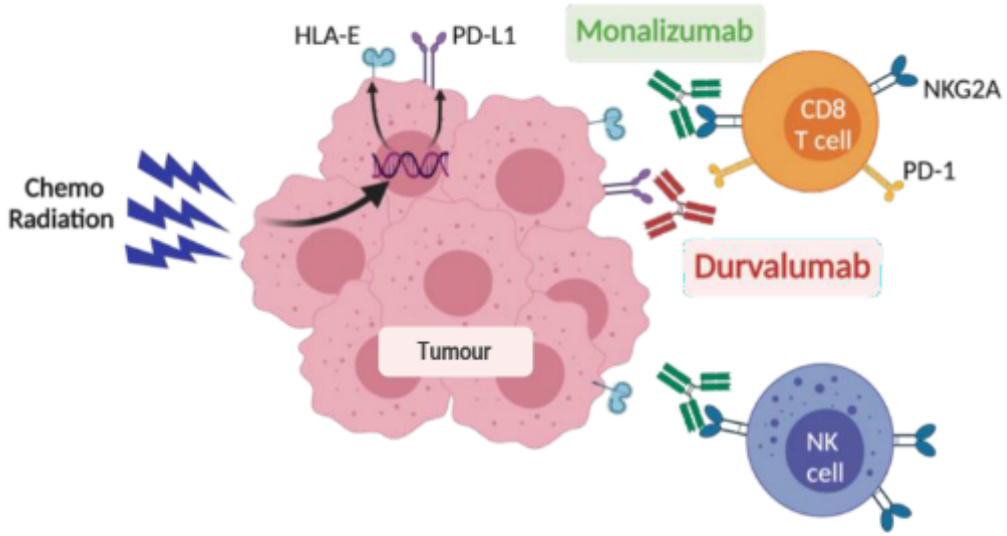
L Paz-Ares, Annals of Oncology, 2020

Rationale for combining durvalumab with oleclumab (anti-CD73) or monalizumab (anti-NKG2A)





- RT induces expression of CD73 and HLA-E (NKG2A ligand), which inhibit antitumour immune response[1-4]
- Oleclumab inhibits CD73 to reduce extracellular adenosine production, thereby promoting antitumour immunity.[5] Oleclumab combined with durvalumab produced durable responses with manageable safety in a Ph I study of advanced *EGFR*m NSCLC[6]
- Monalizumab blocks NKG2A to reduce inhibition of NK and CD8+ T cells.[7] Monalizumab combined with cetuximab had promising activity with manageable safety in a Ph I/II trial of patients with R/M HNSCC[8]
- Combinations of RT and anti-CD73/NKG2A ± anti-PD-(X) show increased antitumour activity in preclinical models[1,2,4]

ATP, adenosine triphosphate; AMP, adenosine monophosphate; DC, dendritic cell; *EGFR*m, epidermal growth factor receptor mutant; MDSC, myeloid-derived suppressor cell; NK, natural killer; PD-(L)1, programmed cell death (ligand) 1; R/M HNSCC, recurrent/metastatic head and neck squamous cell carcinoma; RT, radiotherapy; TAM, tumour-associated macrophages

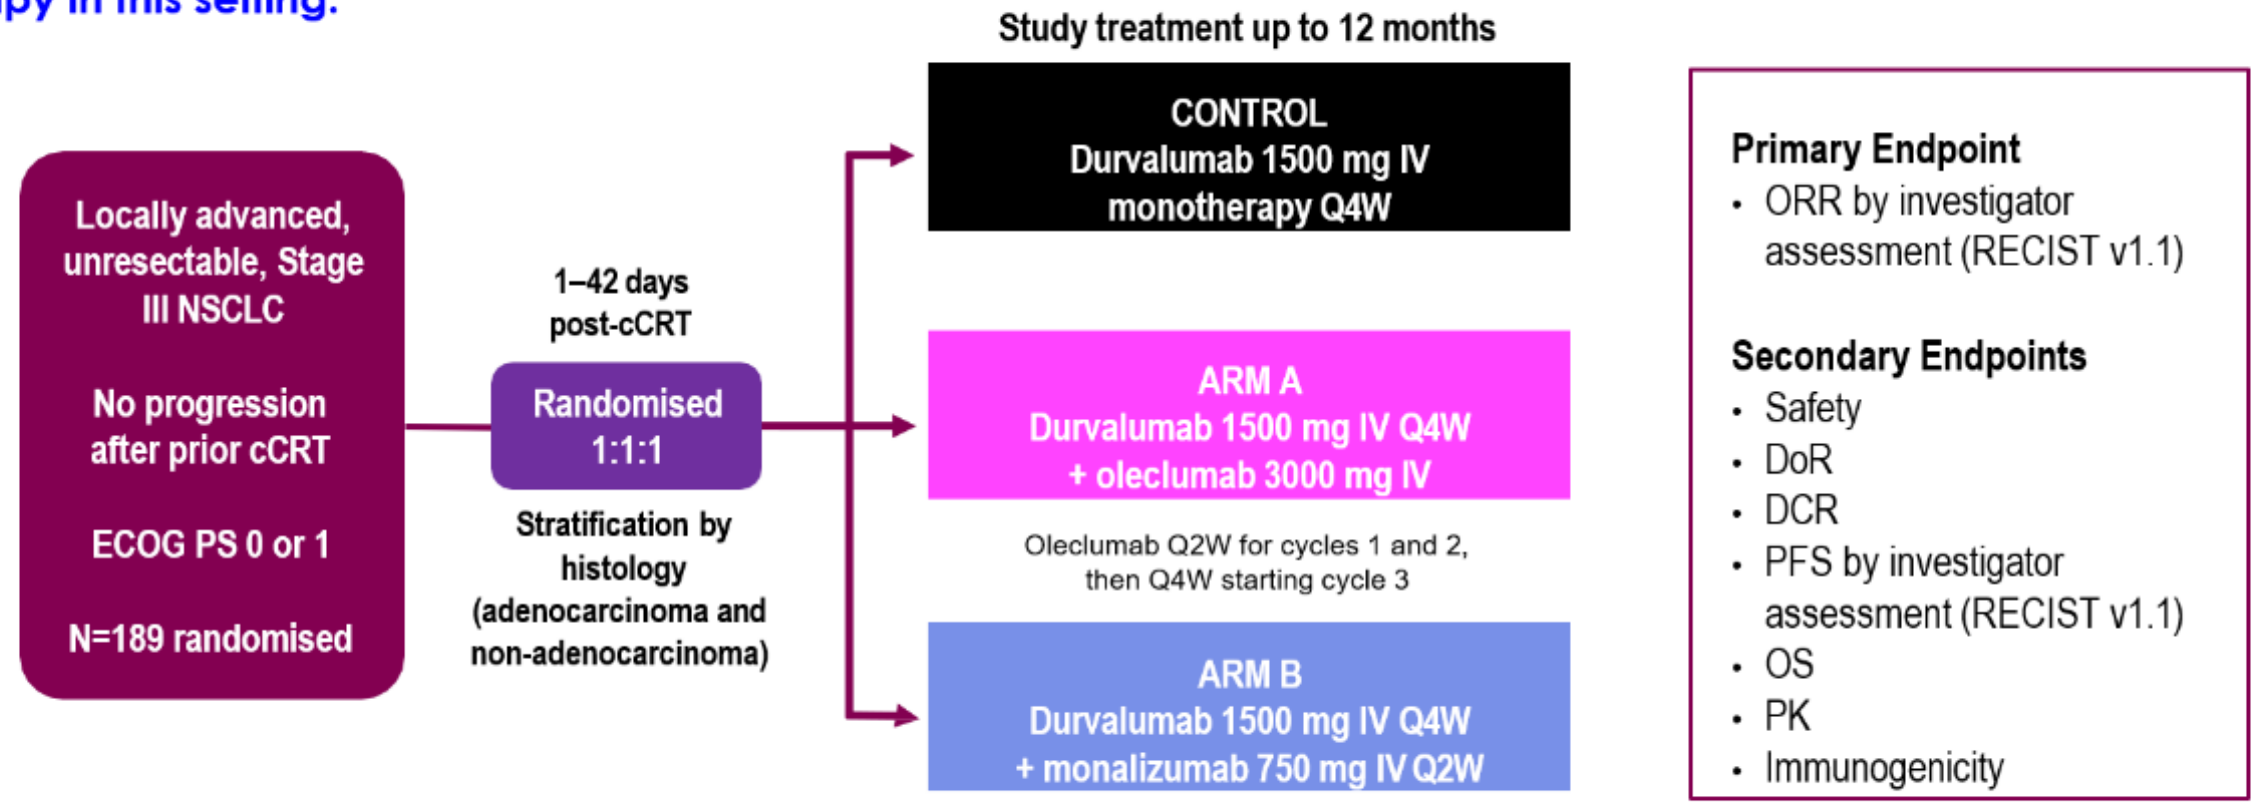
COAST: Combination Platform Study in Unresectable Stage III NSCLC. Phase 2, global, randomized open- label study of durvalumab alone or combined with the anti-CD73 mAb oleclumab or anti-NKG2A mAb monalizumab as consolidation therapy in this setting:



- A planned sample size of 60 patients per arm was designed to provide acceptable precision in estimating antitumour activities in an early phase setting
- Between Jan 2019 and Jul 2020, 189 patients were randomised of whom 186 received D (n=66), D+O (n=59) or D+M (n=61)
- As of 17 May 2021, all patients had a minimum of 10 months potential follow-up and the median actual follow-up was 11.5 months (range, 0.4–23.4; all patients)

D, durvalumab; DCR, disease control rate; DoR, duration of response; ECOG, Eastern Cooperative Oncology Group; IV, intravenously; M, monalizumab; O, oleclumab; ORR, objective response rate; OS, overall survival; PFS, progression-free survival; PK, pharmacokinetics; PS, performance status; RECIST, Response Evaluation Criteria in Solid Tumours

Baseline characteristics and prior CRT

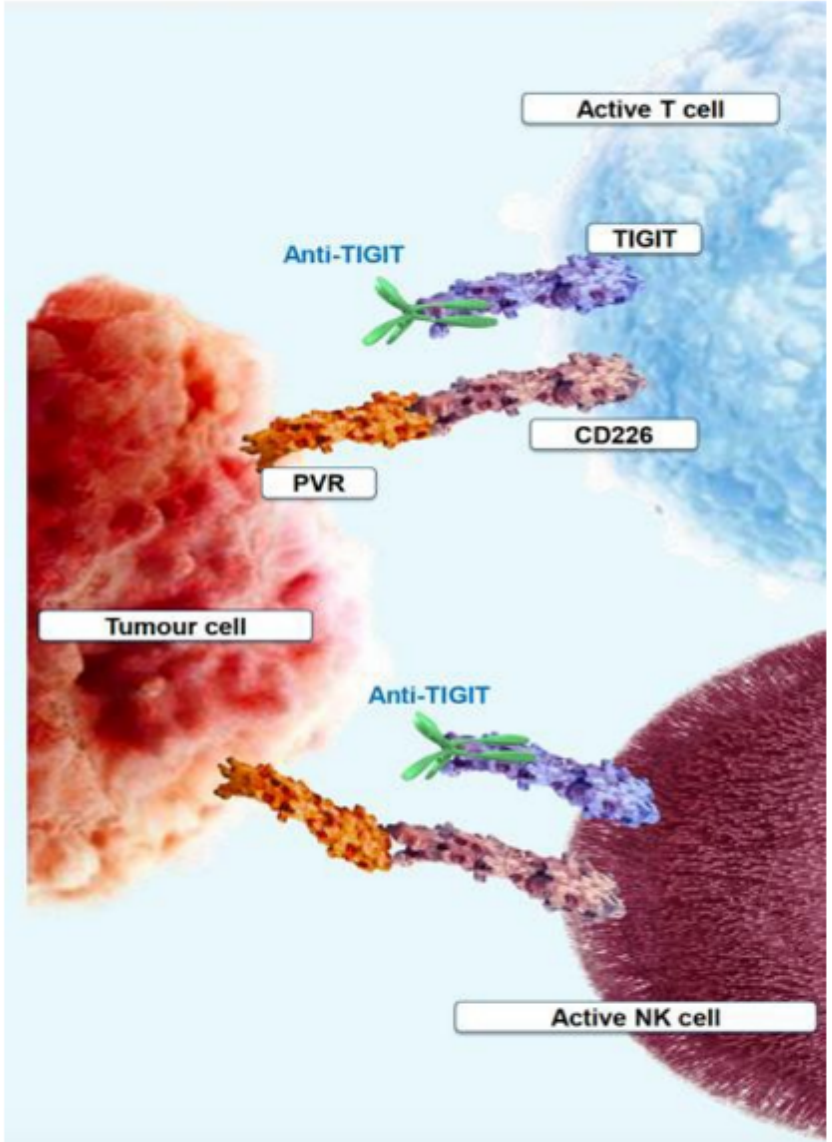
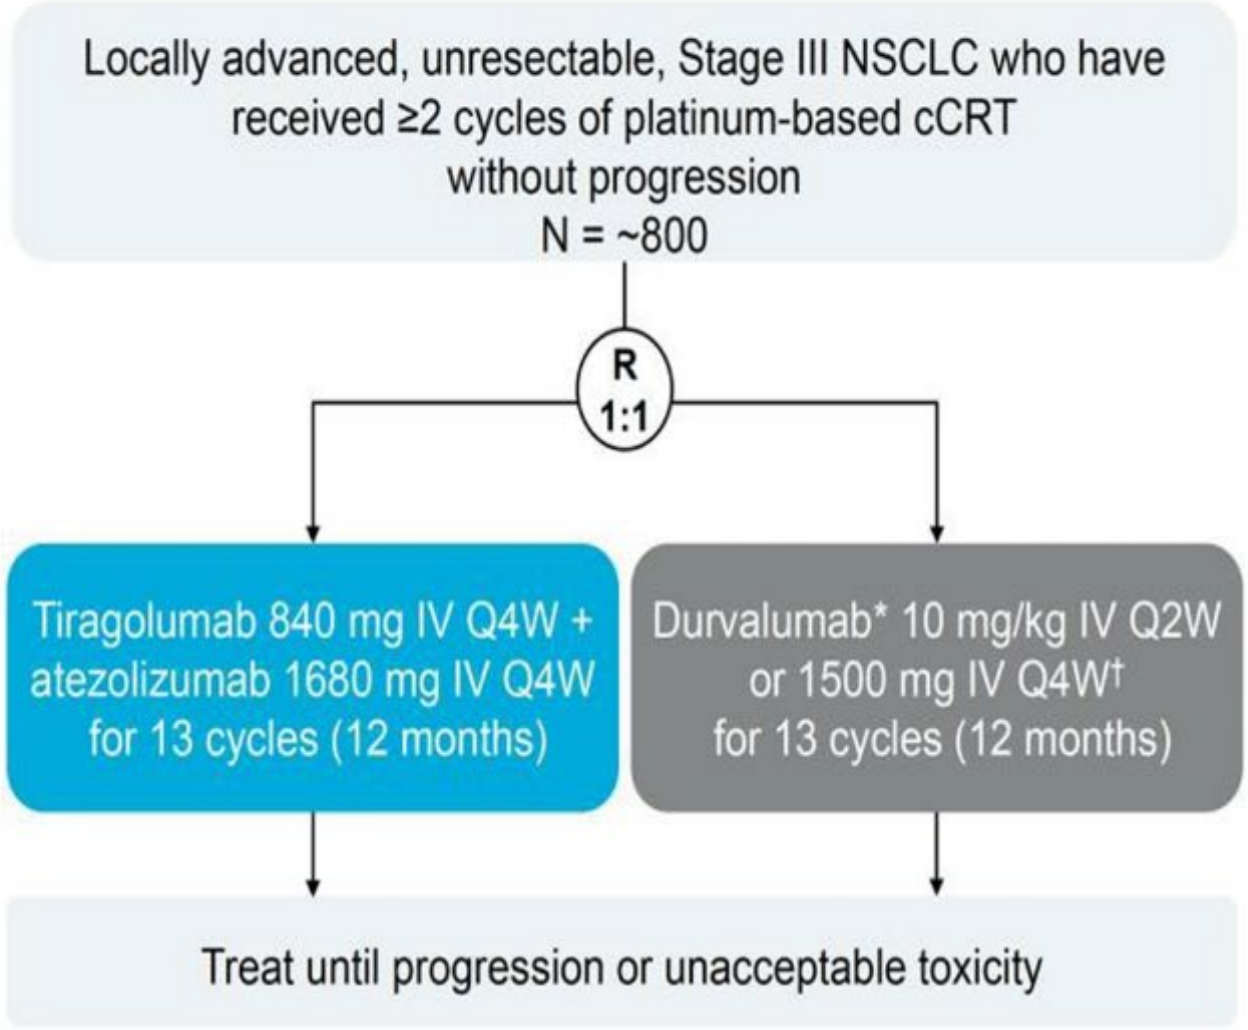
Anti-TIGIT Antibodies:

- TIGIT is a novel inhibitory checkpoint on activated T cells and NK cells.
- Tiragolumab is a fully human IgG1/kappa anti-TIGIT monoclonal antibody; blocks binding to its receptor PVR.
- Inhibition of TIGIT/PVR may amplify the durability / duration of anti-tumor response of anti-PD-L1/PD-1 antibodies



SKYSCRAPER- 03:



*Durvalumab at Q2W or Q4W based on the investigator in consultation with the patient and/or local standard of care;
†For patients who weigh ≥30 kg; Q2W, once every 2 weeks; Q4W, once every 4 weeks; IV, intravenous

Primary endpoint: PFS by independent review facility assessment per RECIST v1.1

Key secondary endpoints: OS, investigator-assessed PFS, ORR, DOR, PFS and OS rates at 12, 18 and 24 months

Safety, pharmacokinetics, immunogenicity and biomarkers will also be evaluated

Role of Targeted Therapies Following Chemo-RT

GenesisCare

OLA

FLASCO

FAU MEDICINE

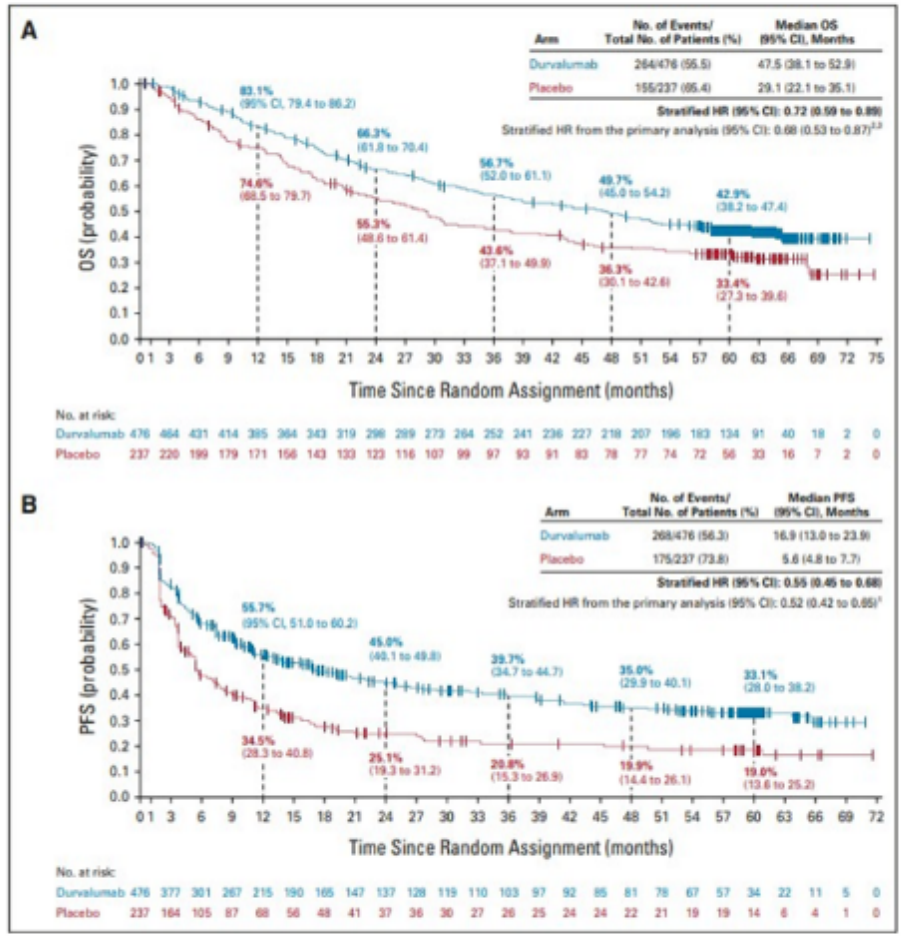
FLORIDA ATLANTIC UNIVERSITY

Outcomes in Unresectable Stage III NSCLC

- Despite improvements in chemoRT over the last 2 decades, outcomes for unresectable stage III NSCLC have been poor

- Recently updated outcomes for PACIFIC
  - 5-yr OS- 42.9% vs. 33.4%
  - 5-yr PFS- 33.1% vs. 19%

- Though Durvalumab significantly improves OS and PFS, most patients are still not cured and less than 1/3 are alive without progression at 5 years



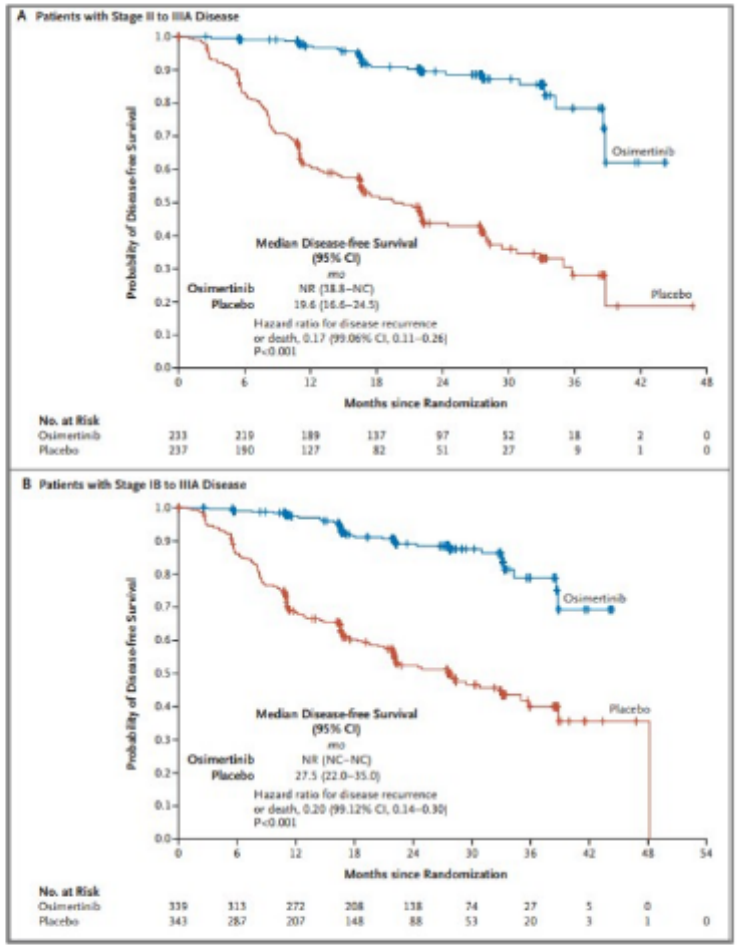
Previous Targeted Therapy Trials

- Unfortunately, prior targeted therapy trials in stage III NSCLC have been unsuccessful in changing the standard of care

- Most have utilized early generation EGFR inhibitors or PARP inhibition
  - EGFR/ALK
    - CALGB 30106
    - SWOG S0023
    - Rigas et al
    - RTOG 1306 (induction TKI)
  - PARP
    - SWOG 1206
    - M14-360

Rationale for Consolidation Targeted Therapy

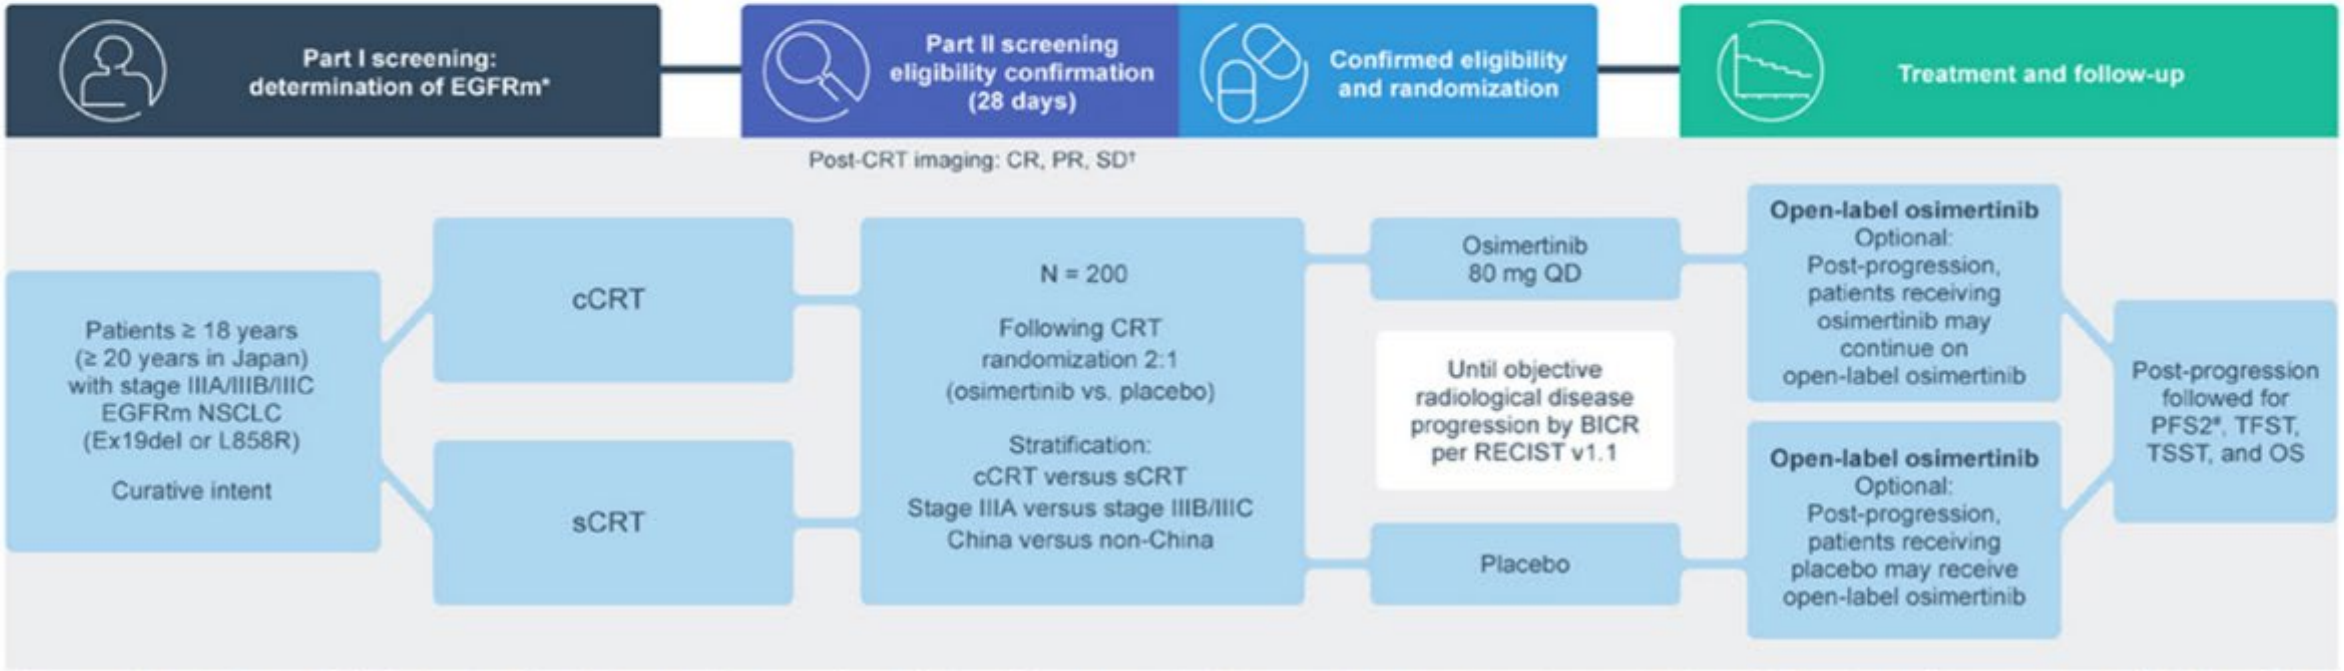
- Some patients are not candidates for consolidation immune therapy (e.g. transplant, autoimmune disease) or are at high risk for AEs.
- EGFR-m patients may have worse outcomes after chemoradiation compared to EGFR-wt.
- Significantly improved DFS in the adjuvant setting (ADAURA) and high rates of activity and improved clinical outcomes in stage IV.



Qin et al. Expert Rev Anticancer Ther 2019;19(6):533-539.
Wu et al. N Eng J Med 2020;383:1711-23.

Ongoing Trials

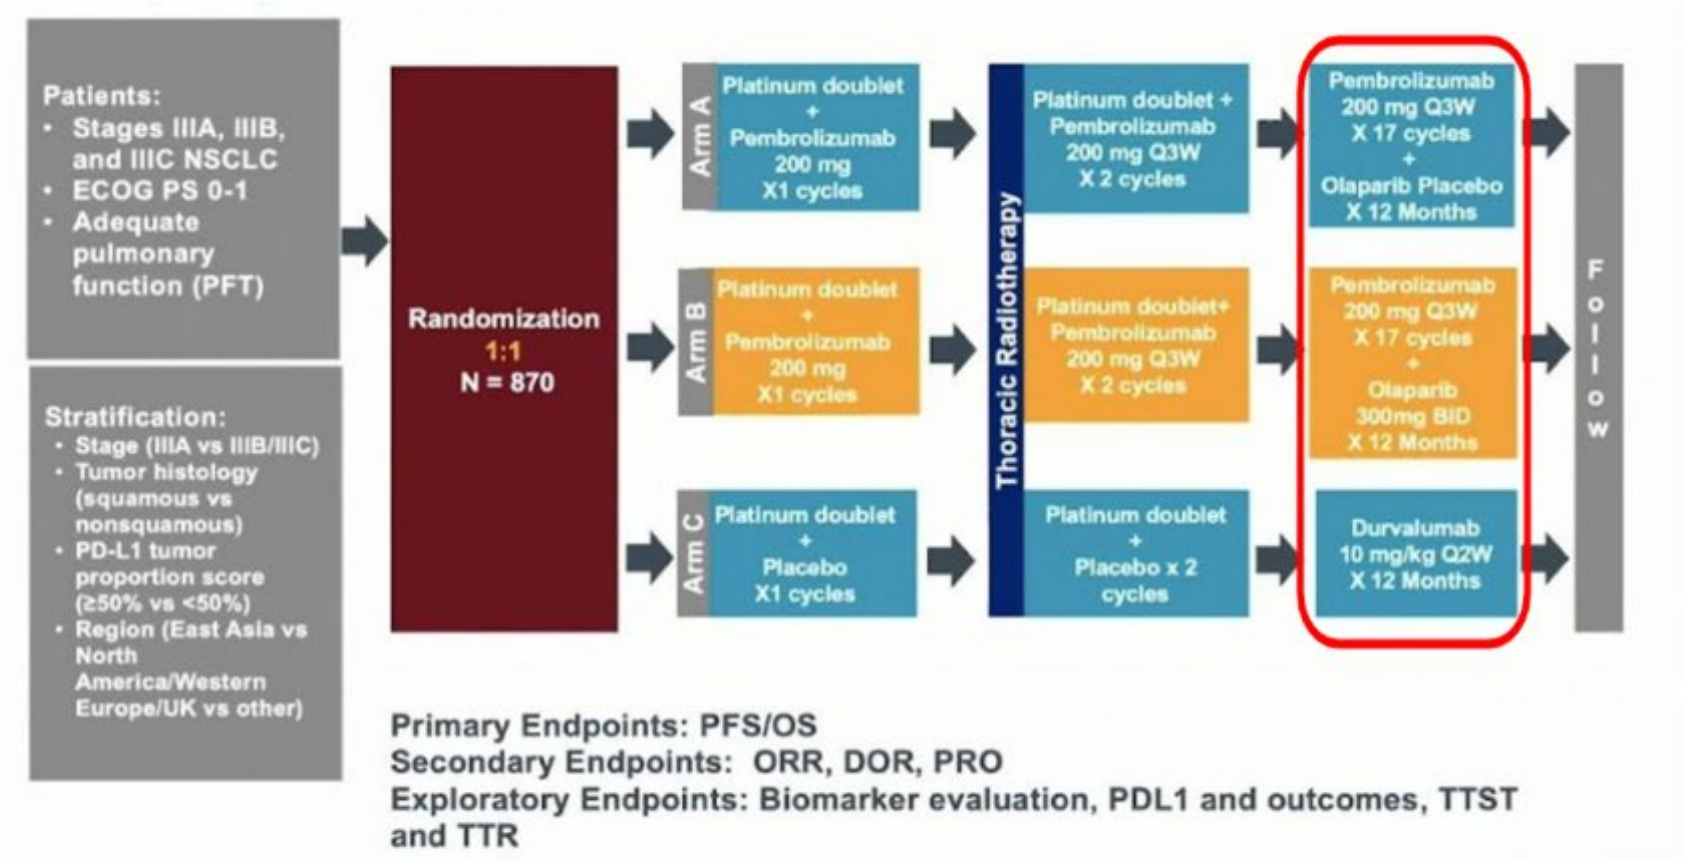
- **LAURA Trial (NCT03521154)**
  - Osimertinib Maintenance After Definitive Chemoradiation in Unresectable EGFR Mutation+ Stage III NSCLC
  - Primary Endpoint- BICR- confirmed PFS
  - Secondary Endpoints- CNS PFS, OS, PFS by mutation status, safety
  - 1st pt- July 2018
  - Expected results- late 2022



*Patients with a local cobas® EGFR Mutation Test v2 tissue positive result from a CLIA-certified or accredited laboratory do not require part I screening. †Post-CRT imaging performed to assess CR, PR and SD up to 28 days before randomization. ‡Assessment of PFS2 will not be collected after the primary PFS analysis.

Ongoing Trials

- KEYLYNK-012 (NCT04380636)
  - ChemoRT +/- Pembro → Pembro +/- Olaparib vs. Durvalumab

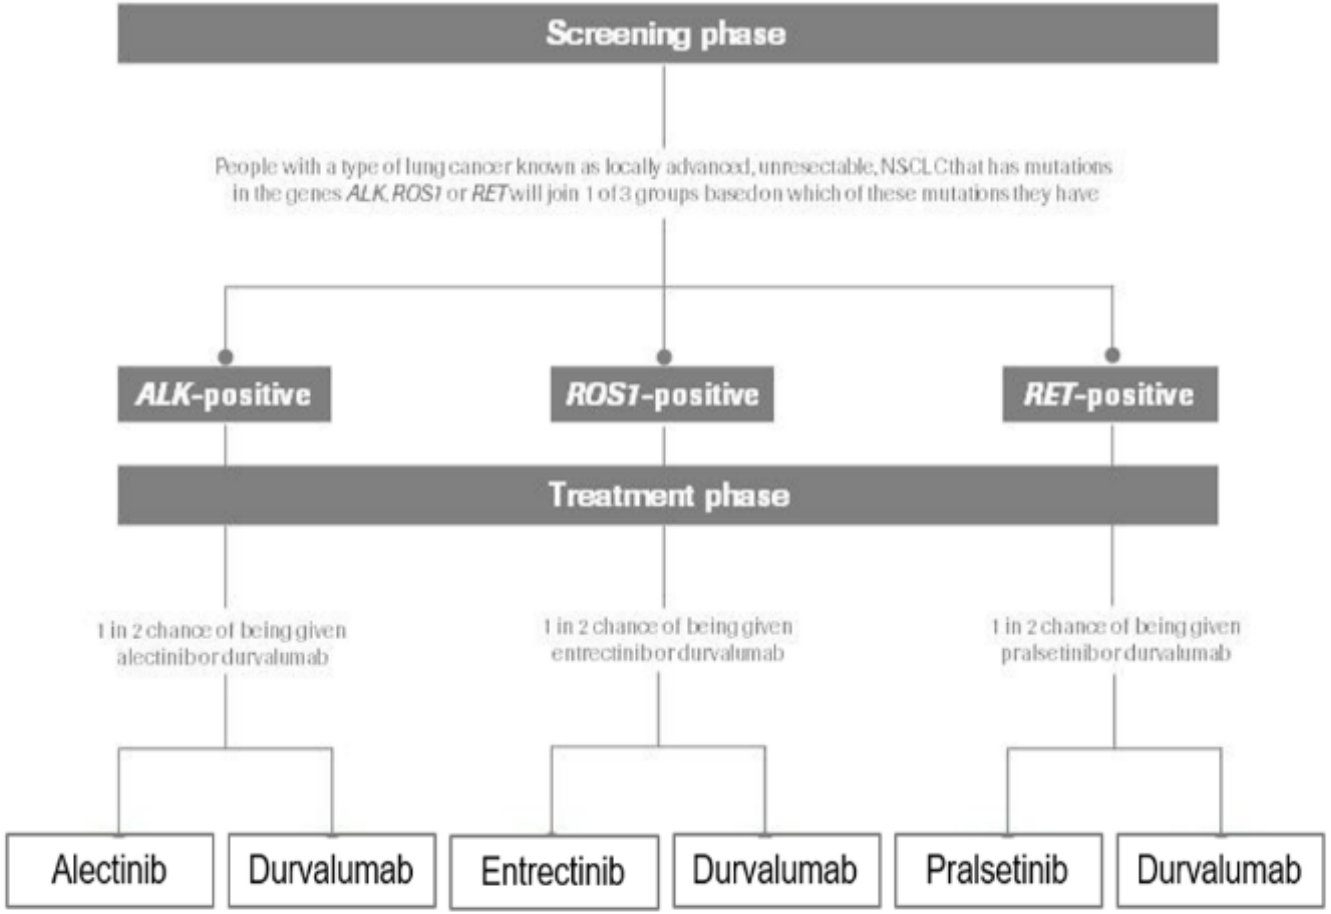


Start date- July 2020

Estimated End- July 2026

Ongoing Trials

- Roche Study
  - Consolidation targeted agent vs. SOC immunotherapy
  - 3 cohorts (ALK, ROS1, and RET positive)
  - All cohorts randomized against Durvalumab
  - Targeted tx duration- 3 years
  - Planned enrollment- 320 pts
  - Not yet open



Conclusion

- The placebo-controlled, Phase 3 PACIFIC study established consolidation durvalumab as SOC for patients with unresectable Stage III NSCLC who have not progressed after cCRT.
  - Five-year data from PACIFIC demonstrated robust and sustained OS plus durable PFS benefit with durvalumab in this patient population
    - **42.9% remain alive** and **33.1% remain alive and progression-free** at 5 years

- COAST is the **first randomised Phase 2 study** to show evidence of improved outcomes with novel IO combinations in the PACIFIC setting ("additional immunomodulation").

- Both combinations (D+O and D+M) numerically increased ORR and significantly improved PFS versus durvalumab alone:
  - PFS benefit with both combinations was observed across various subgroups, including those based on histology, ECOG PS, prior platinum-based CT, and PD-L1 status.

- Addition of an anti-TIGIT antibody to immunotherapy following concurrent chemoradiation is under investigation.

- Consolidation with targeted therapies following chemoradiation for stage III NSCLC is a promising strategy; a number of trials are underway in EGFR, ALK, ROS1, RET, and PARP to evaluate this approach.

- Biomarkers are needed to identify those who may benefit most from escalation of therapy.

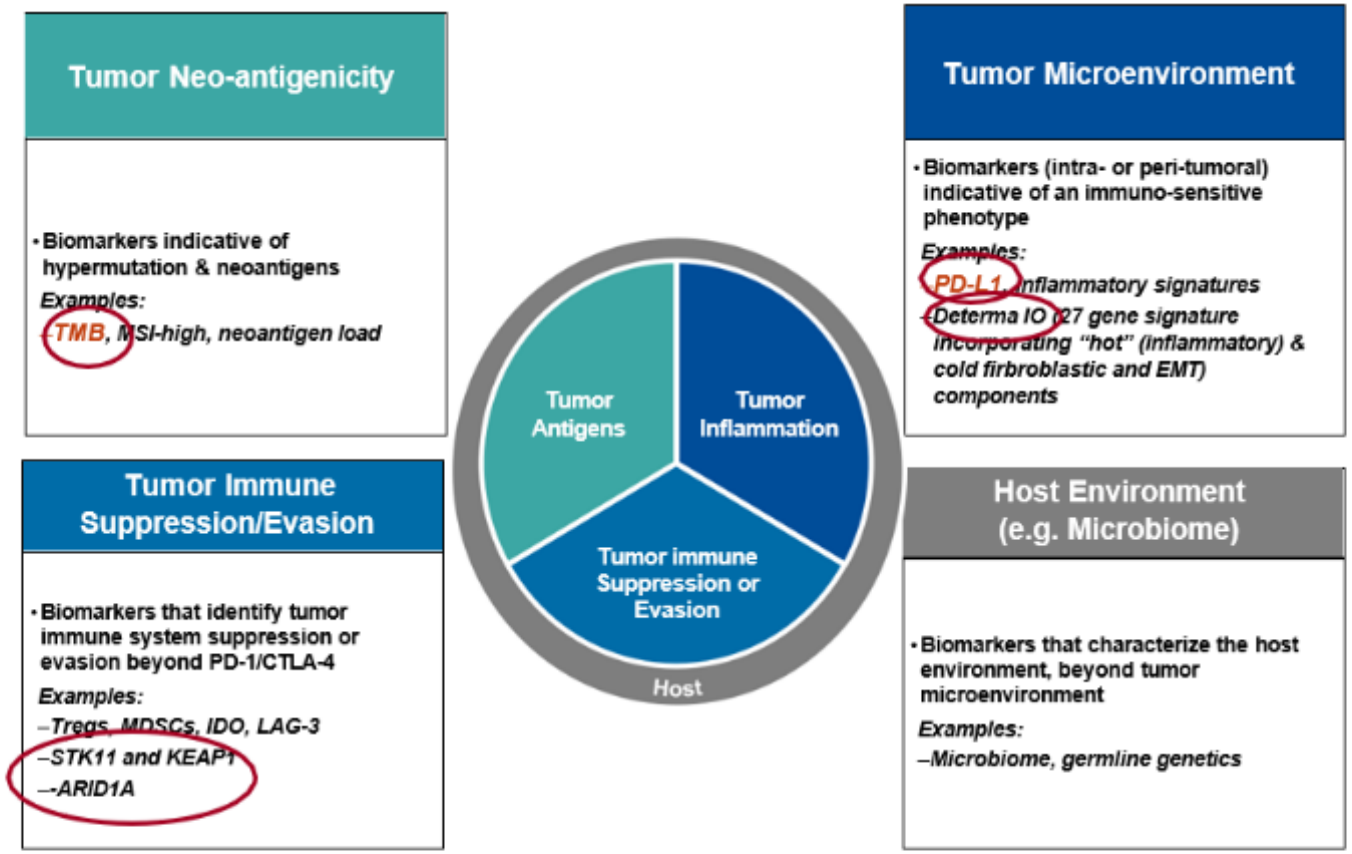
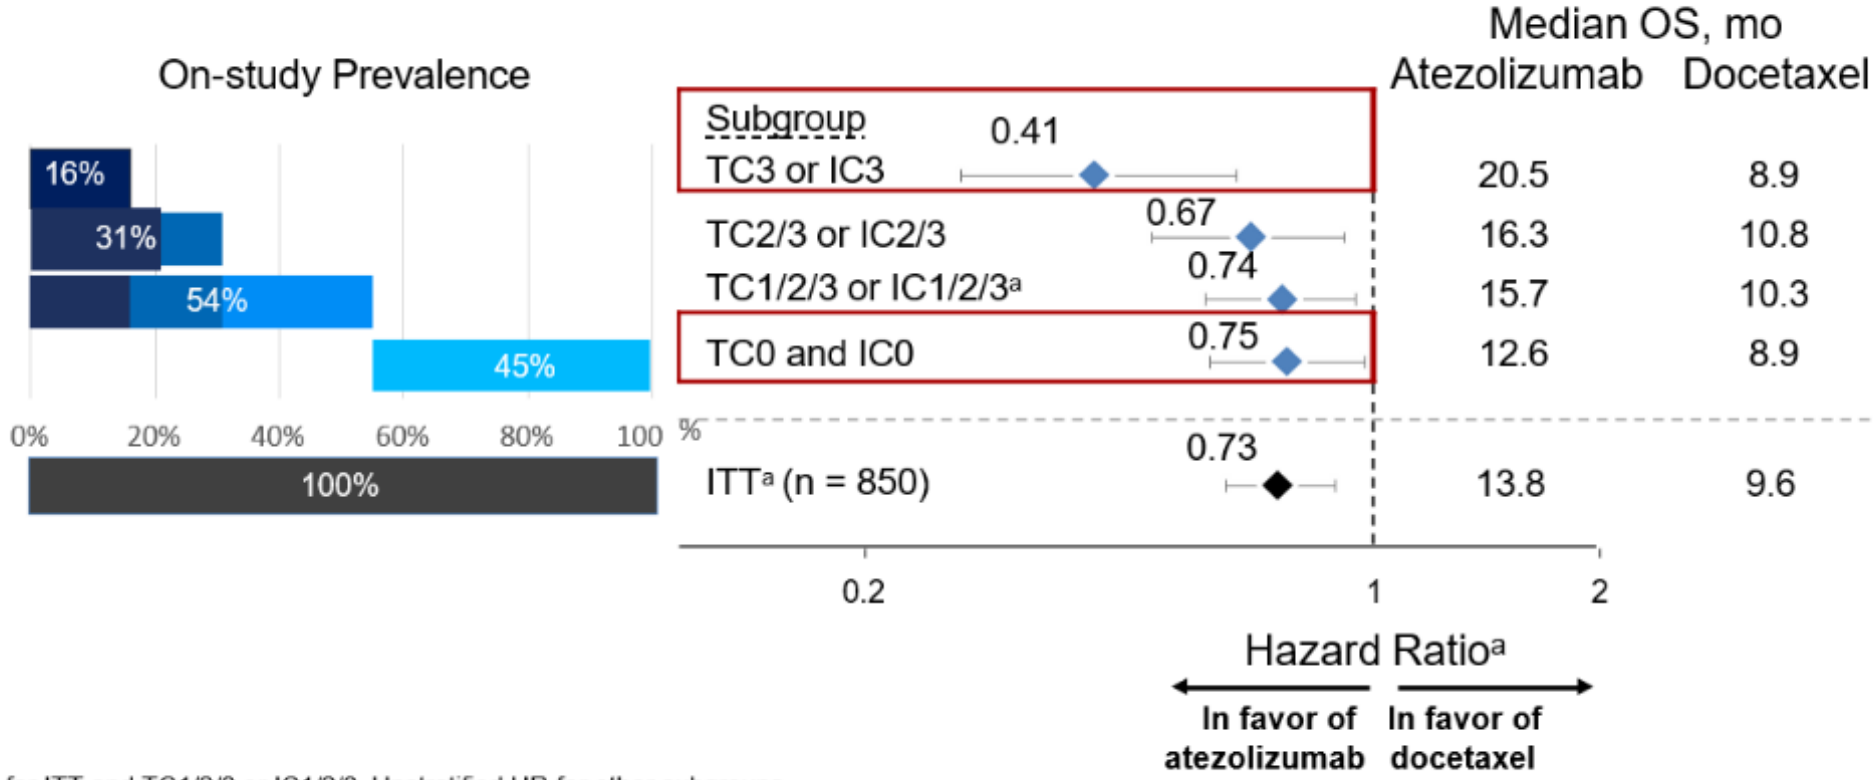
Immune Phenotype as potential Predictive Biomarkers for benefit from Checkpoint Immunotherapy



Adapted from Blank CU, et al. Science 2016;352:658–60.

OAK (Atezolizumab vs Docetaxel) in 2nd line+ Advanced NSCLC: OS by PD-L1 Expression



aStratified HR for ITT and TC1/2/3 or IC1/2/3. Unstratified HR for other subgroups.
TC, tumor cells; IC, tumor-infiltrating immune cells; OS, overall survival.

Rittmeyer. Gandara et al. Lancet. 2017;389:255-65.

TMB as a Candidate Predictive Biomarker for Cancer Immunotherapy

- **Somatic mutations in cancers** produce **neoantigens** that induce anti- tumor immune responses
- **TMB is an emerging predictive biomarker** for cancer checkpoint immunotherapy (CIT)
- TMB can be estimated using whole-exome sequencing **(WES)** or comprehensive genomic profiling by NGS **(e.g., FoundationOne & FACT in blood[bTMB]) . MSK-IMPACT. Guardant OMNI** in blood[1-8]
  - Studies show that TMB either by WES or CGP correlate with each other & with efficacy of CPI therapy in multiple cancer types[1-3]
- **Predicted neoantigen load (NAL),** a component of TMB most closely linked to immune response, correlates with F1 TMB & OMNI[4,5,7,8]
- **TMB identifies a distinct patient population** not currently captured by PD-L1 IHC or other immune biomarkers[5,6]

IHC, immunohistochemistry; PD-L1, programmed death-ligand 1; TMB, tumor mutational burden.

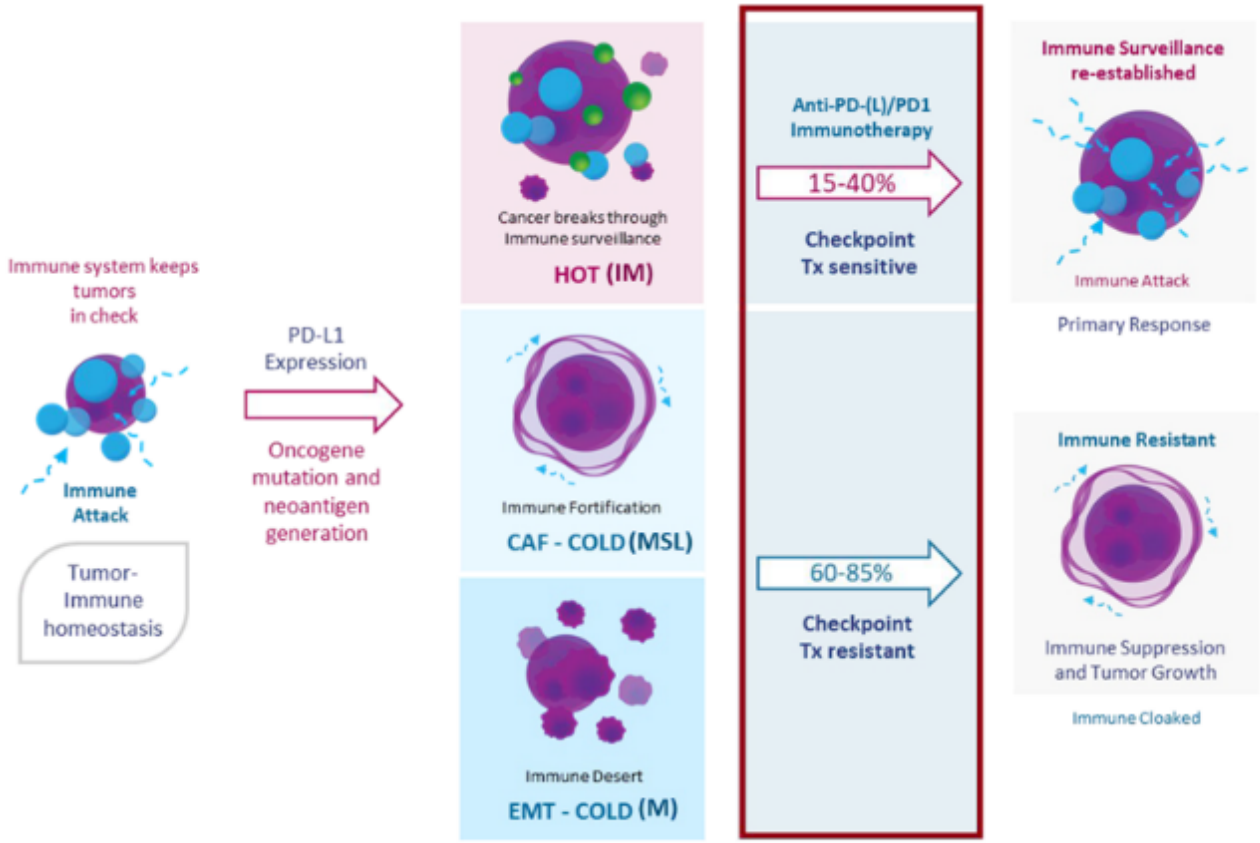
27 gene assay for Immunoreactivity (Determa-IO) reflecting both "Hot" and "Cold" components of the Immune microenvironment

- Determa –IO: run as an algorithm on whole transcriptome RNAseq data
- Translated into an RTPCR assay for clinical use
- Measures 3 distinct components of the tumor immune microenvironment:
  1. Immune infiltrates (IM) ("Hot")
  2. Fibroblast/ECM component (MSL) ("Cold")
  3. Epithelial-Mesenchymal Transition (M) ("Cold")
- Specimen Requirements
  - FFPE tissue block or 5 slides (5 µm)
  - 20% tumor purity
  - Turn-around time: 5 days

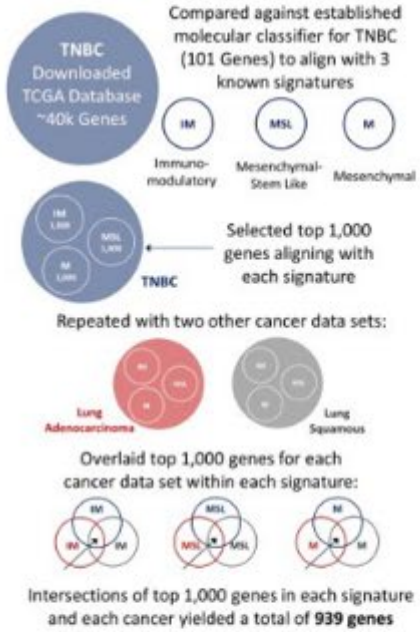
Nielsen et al Cell/Heliyon 2021.

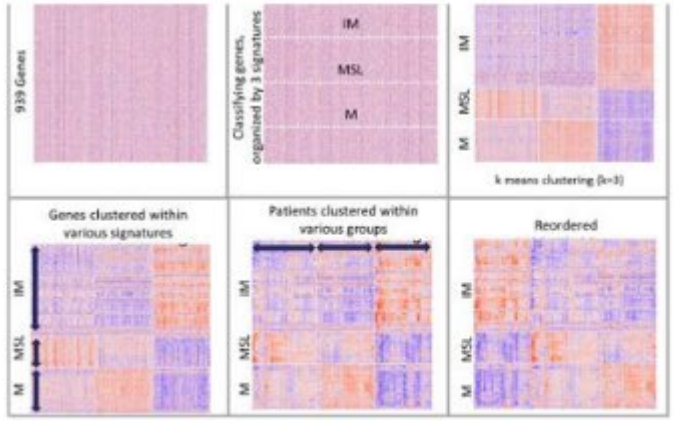


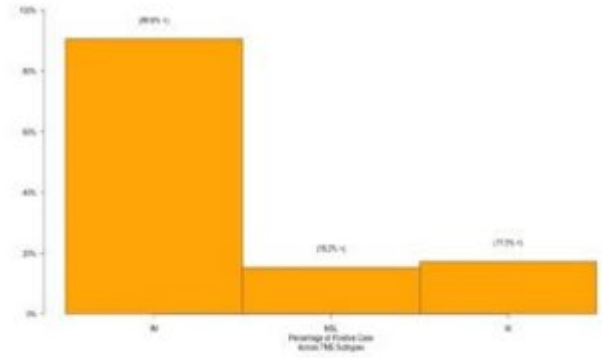
Seitz et al. AACR 2021

Applying Determa IO Across Cancer Types

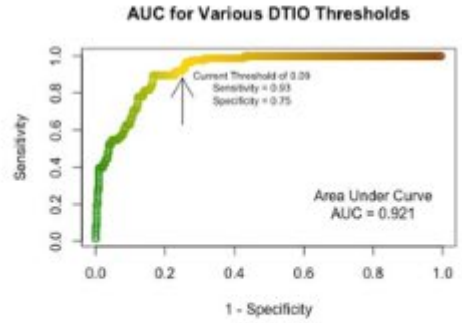
Pathway modeling shows consistent IO gene expression patterns across several solid tumor types



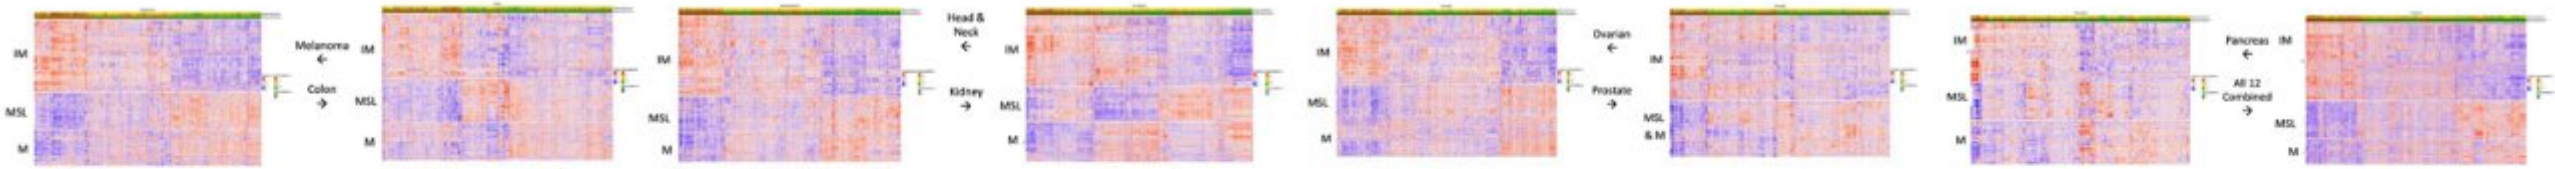




- **(Above Left)** The combined 939-gene set representing the known IM, MSL, and M signatures were clustered by gene and patient
- **(Above Right)** The 27-gene predictor was then calculated for the 406 patients and overlaid on the Heatmap (top bar, right) showi clear association with left side ("Immune Hot") portion of the map.



Similar patterns have been shown in 10+ tumor types to date:



Seitz et al. AACR 2021

Determa-IO Clinical Validation

Clinical validation data presented in multiple tumor types to date

- Non-Small Cell Lung Cancer (NSCLC)
- Triple Negative Breast Cancer (TNBC)
- Metastatic Urothelial Cancer
- Renal Cell Carcinoma
- Colorectal Cancer

- ❑ Over 1,000 patients tested across these tumor types.
- ❑ Studies involving all 4 of the FDA approved checkpoint inhibitors.
- ❑ Multiple additional studies in these and other tumor types are ongoing.

Determa IO Analysis: NSCLC Checkpoint Inhibitor Therapy

Advanced NSCLC Patients Treated with Pembrolizumab or Nivolumab

- N=71
- Histology: 18 squamous, 39 adeno, 12 other
- All patients had completed eight weeks of treatment
- 58 received ICI monotherapy
- 13 received ICI + chemotherapy

- Primary Endpoint: PFS

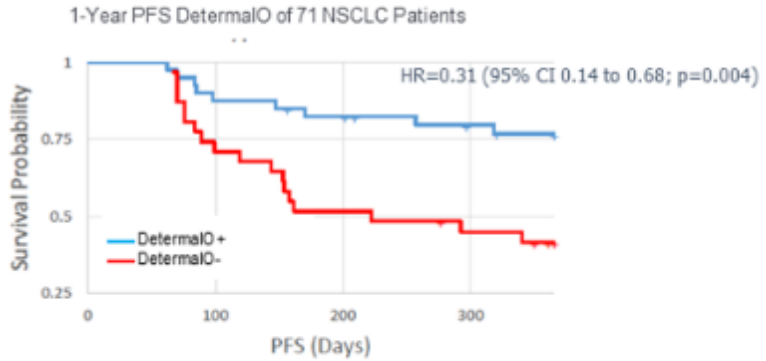
NSCLC (N=71)

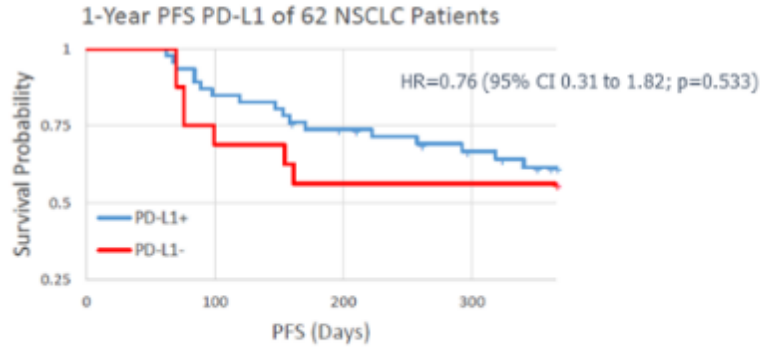
Marker	Cases	Neg.	Pos.	Percent Positive	
DetermaIO (-/+)	71	32	39	55%	
PD-L1	66	19	47	71%	1% threshold
TMB	41*	17	24	59%	>10 mutations/MgB

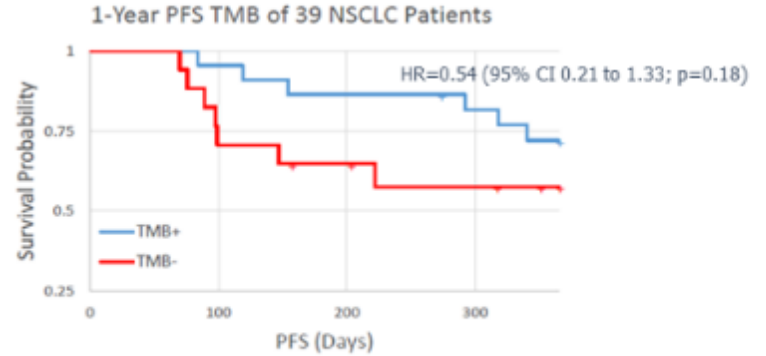
Ranganath et al. BMC Cancer 2022

DetermaIO predictive of Immunotherapy outcome independent of PD-L1 or TMB scores, demonstrating superiority to both biomarkers

Progression-free survival comparing DetermaIO to PD-L1 and TMB analysis







GenesisCare OLA FLASCO FAU MEDICINE FLORIDA ATLANTIC UNIVERSITY

Conclusions

- Although PD-L1 and TMB are approved biomarkers for checkpoint immunotherapy, each has significant limitations at present.
- Composite IO signatures incorporating genomic markers may yield increased predictive value.
- Integrating components of the **TME** into a biomarker strategy is another approach to to improve predictive value.
- Determa IO is an analytically validated gene signature incorporating both "hot" and "cold" components of the **TME**.

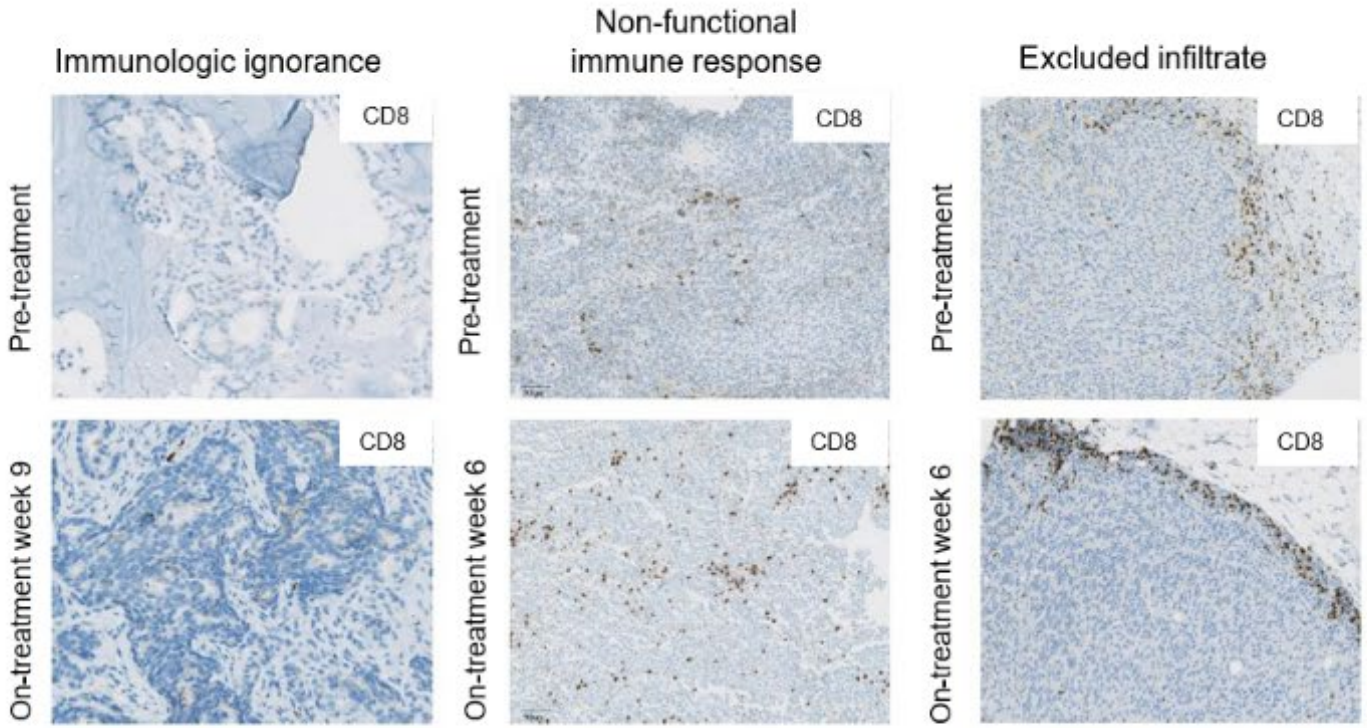
Biomarker Analyses
Defining the Profile of Non-responders

Immune Desert



Immune Excluded

- Three distinct patterns of nonresponse were observed
- Most patients who progressed failed to show up-regulation of PD-L1 or evidence of activated T cells
- These results provide evidence for the "inflamed tumor" hypothesis

Clinical case.

60-yr-old female patient heavy smoker in the past (25 py) presented with sudden SOB and pleuritic pain. Work up at the ER (CTA chest) revealed bilateral pulmonary embolism and incidentally a 4.2 cm in LUL as well as bilateral mediastinal adenopathy. Patient is placed on heparin drip and sent for CT guided biopsy. Tissue biopsy revealed adenocarcinoma (TTF-1, Napsin A +; CK20 neg); and TMP is requested. Patient is discharged in stable condition on apixaban. TMP revealed EGFR/ALK/ROS1/BRAF/RET/MET/KRAS/NTRK/HER2 negative, STK11 +, PD-L1 80%. Staging w/u showed no brain metastases and single lesion in L adrenal gland 1.4 cm (SUV 13).

What therapeutic options are considered category 1 by the NCCN?

1. Carbo/Pemetrexed/Pembrolizumab
2. Carbo/Paclitaxel/Bevacizumab/Atezolizumab
3. Cemiplimab
4. Nivolumab/Ipilimumab
5. Carbo/nab-paclitaxel/atezolizumab
6. Carbo/pemetrexed/nivolumab/ipilimumab
7. 2,3,4
8. 4,5,6
9. 1,2,3,4,6
10. 1,2,3,6
11. 1,2,3

For PD-L1 ≥ 50% & no actionable mutation & PS 0-2

Preferred
- **Pembrolizumab (category 1) or**
- **(Carboplatin or cisplatin) + pemetrexed + pembrolizumab (category 1) or**
- **Atezolizumab (category 1) or**
- **Cemiplimab-rwlc (category 1)**

Other Recommended
- **Carboplatin + paclitaxel + bevacizumab[rr,ss] + atezolizumab (category 1) or**
- **Carboplatin + albumin-bound paclitaxel + atezolizumab or**
- **Nivolumab + ipilimumab + pemetrexed + (carboplatin or cisplatin) (category 1)**

Useful in Certain Circumstances
- **Nivolumab + ipilimumab (category 1)**

NCCN v5.2022, 09/26/2022

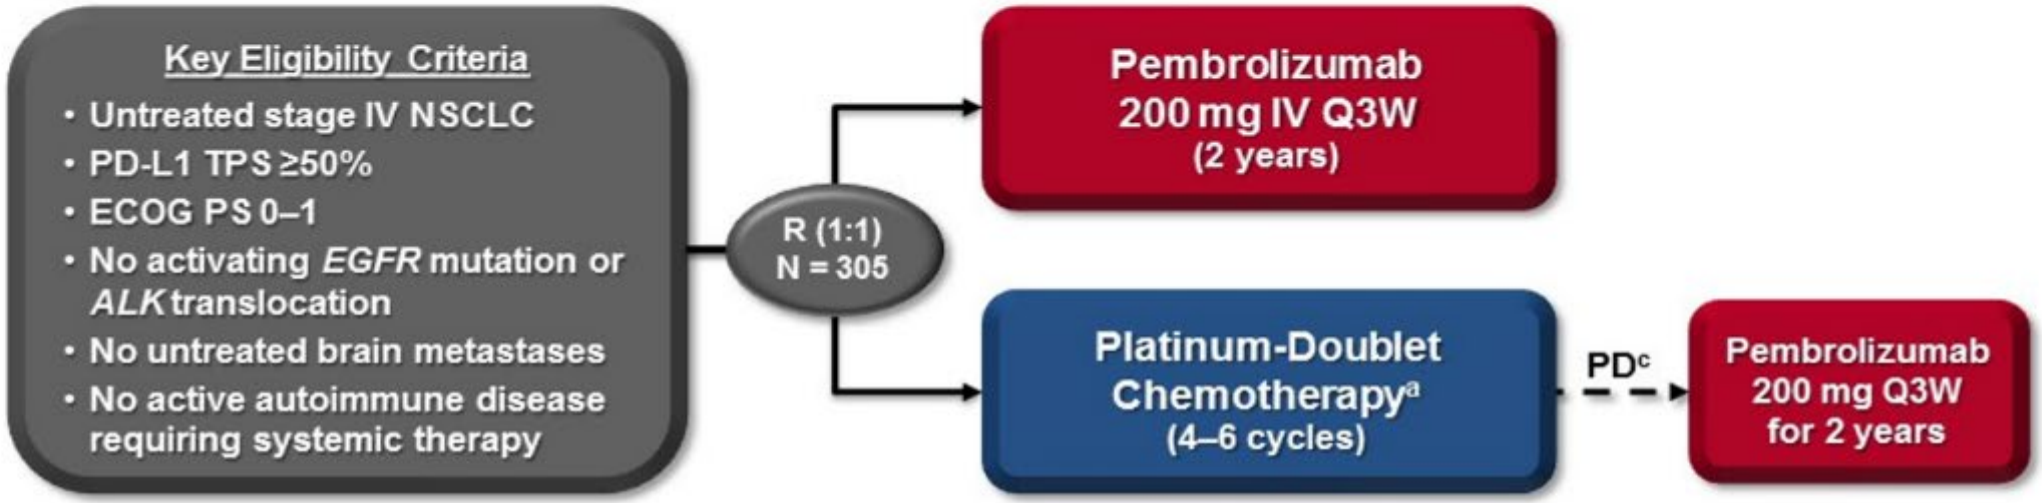
Mono IO

KEYNOTE-024 Study Design (NCT02142738)



End Points

Primary:	PFS (RECIST v1.1, blinded independent central review)
Key secondary:	OS
Secondary:	ORR, safety
Exploratory:	DOR

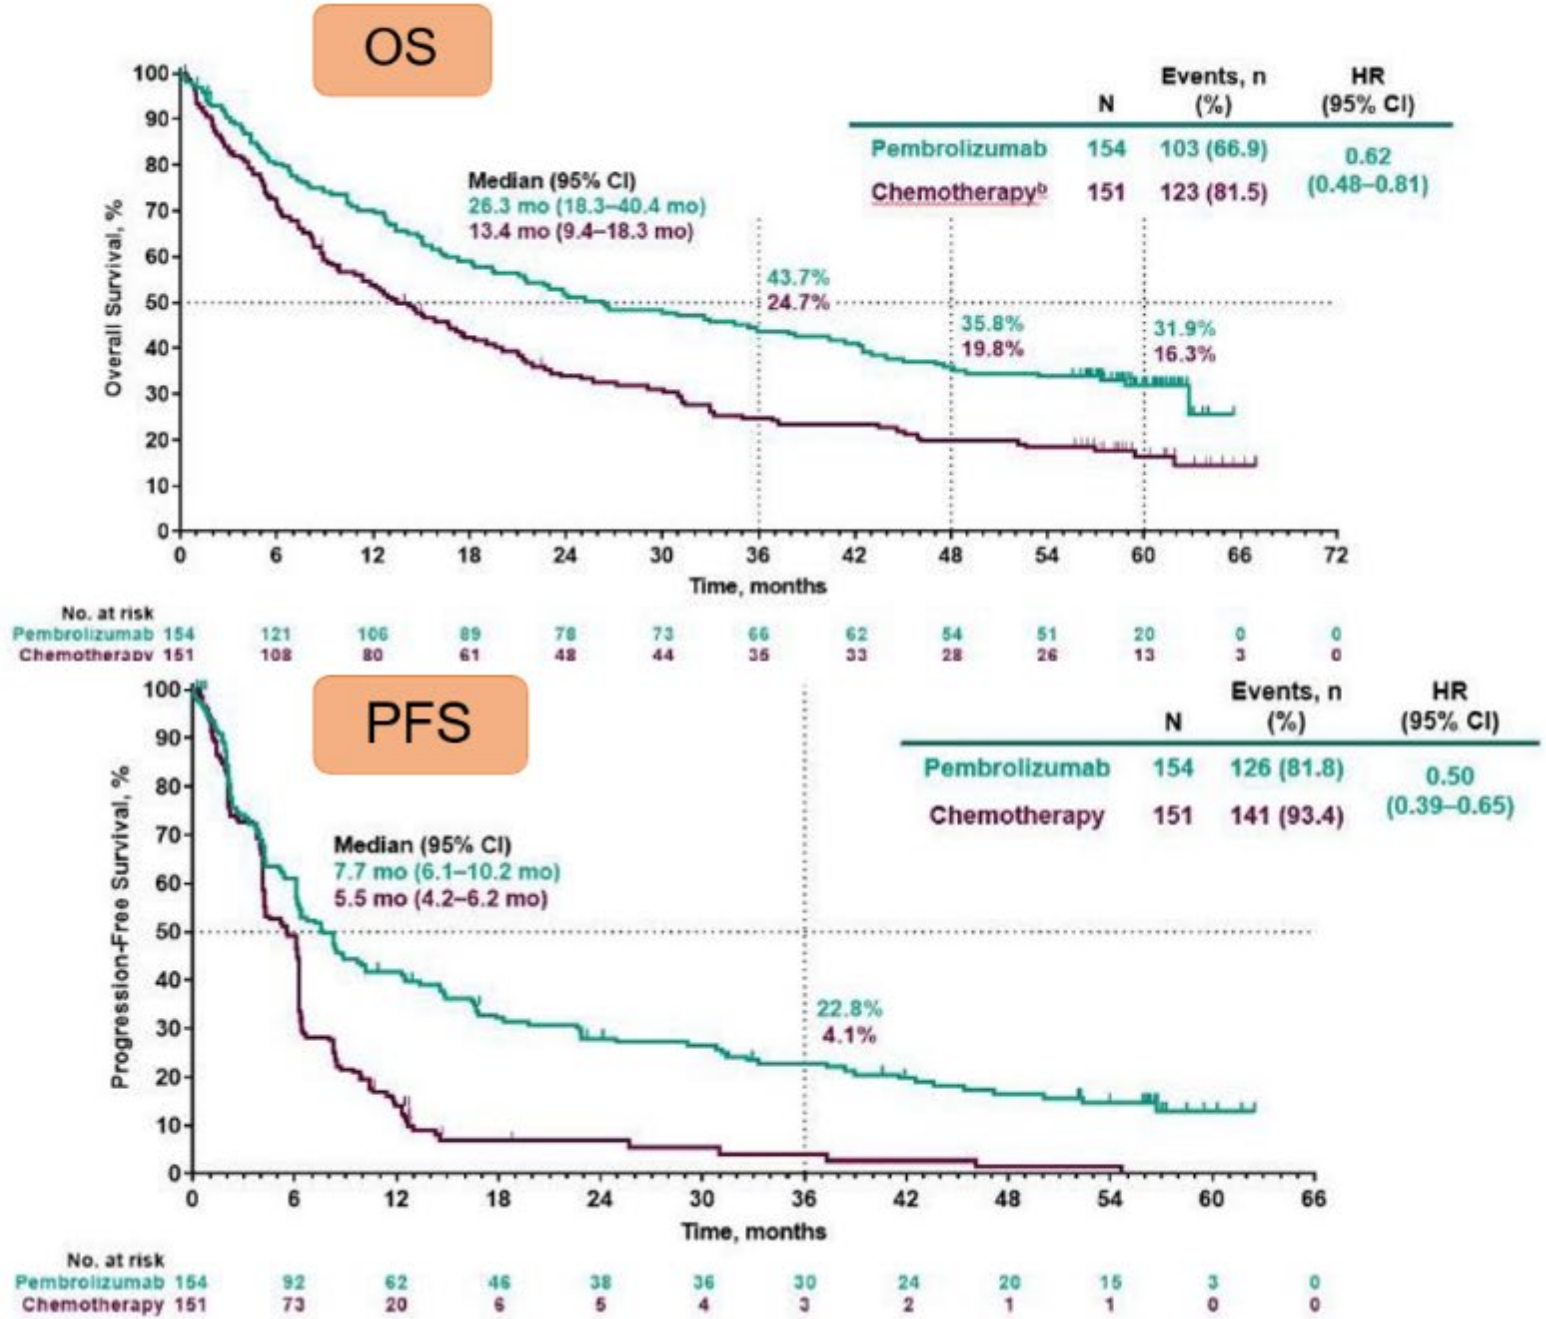
[a]Optional pemetrexed maintenance therapy for nonsquamous disease. [b]Permitted for nonsquamous disease only.
[c]Prior to the DMC recommendation and amendment 6, which permitted those in the chemotherapy arm to be offered pembrolizumab (based on interim analysis 2 data), patients were eligible for crossover when PD was confirmed by blinded, independent central radiology review.

5 Year OS:
Median
26.3 mo (18.3-40.4 mo) 31.9% vs.
13.4 mo (94-18.3 mo) 16.3%
HR: 0.62 (0.48-0.81)

3 Year PFS:
Median
7.7 mo (6.1-10.2 mos) 22.8% vs.
5.5 mo (4.2-6.2 mo) 4.1%
HR: 0.50 (0.39-0.65)

Overall Response Rate:
46.1% vs. 31.1%
Partial Response:
41.6% vs. 31.1%
Complete Response:
4.5% vs. 0

J.R. Brahmer KEYNOTE-024 *ESMO 2020: LBA 51*



KEYNOTE-042 Study Design

B Cho. WCLC Jan 2021

Key Eligibility Criteria

- Untreated locally advanced or metastatic NSCLC of any histology
- PD-L1 TPS ≥1%[a]
- No sensitizing *EGFR* or *ALK* alterations
- ECOG PS 0 or 1
- No untreated or unstable central nervous system metastases
- No history of pneumonitis that required systemic corticosteroids

N = 637

Pembrolizumab 200 mg Q3W for up to 35 cycles[b]

Second-Course Pembrolizumab[b]

Pembrolizumab 200 mg Q3W 17 cycles (1 year)

R 1:1

N = 637

Carboplatin AUC 5 or 6 Q3W + Paclitaxel 200 mg/m² Q3W[c] OR Carboplatin AUC 5 or 6 Q3W + Pemetrexed 500 mg/m² Q3W[c] for up to 6 cycles

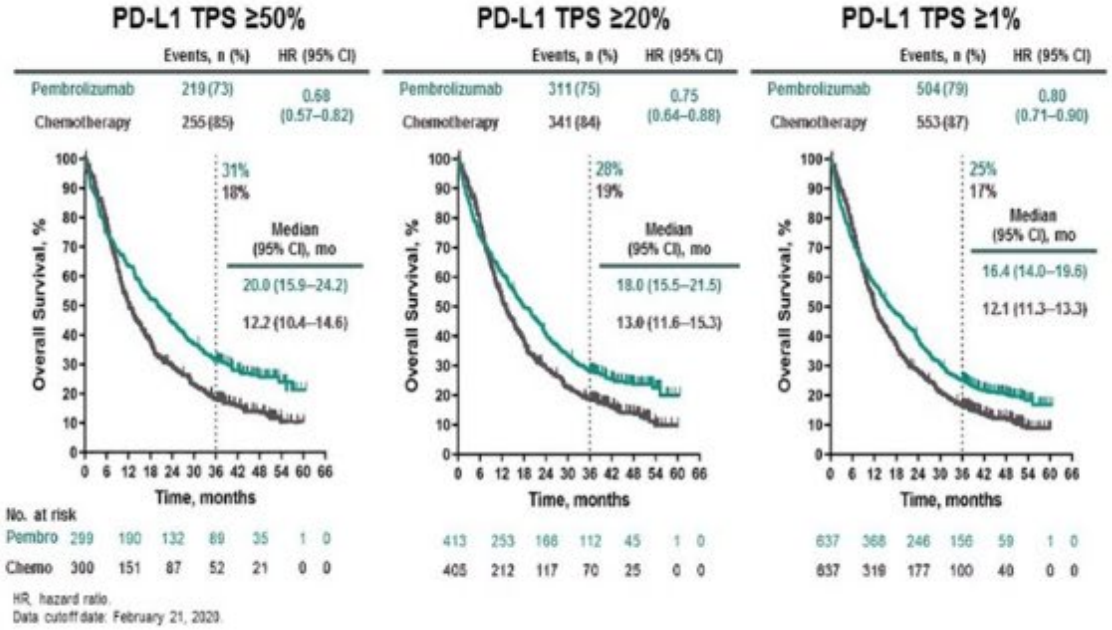
Stratification Factors

- Region (east Asia vs rest of the world)
- ECOG PS (0 vs 1)
- Histology (squamous vs nonsquamous)
- PD-L1 TPS (≥50% vs 1%–49%)

Endpoints

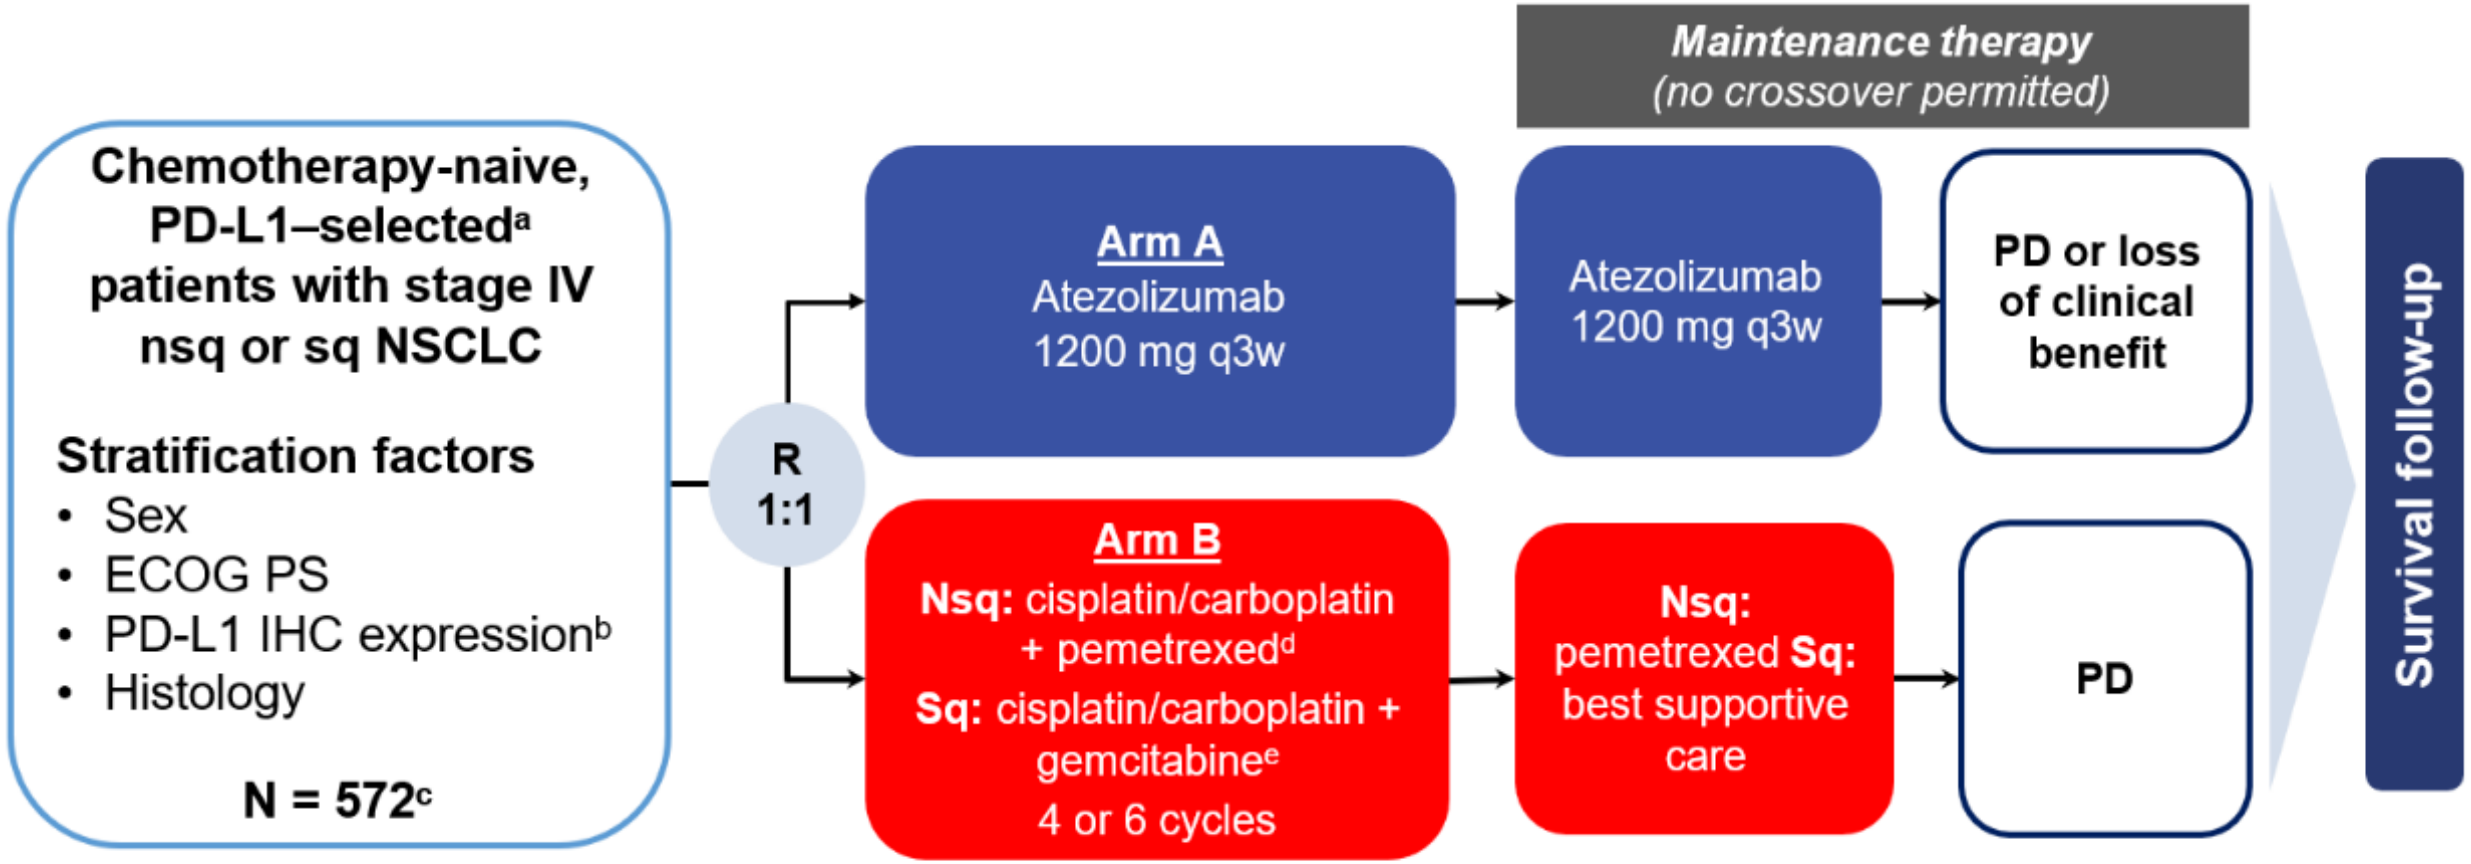
- Primary: OS in PD-L1 TPS ≥50%, ≥20%, and ≥1%
- Secondary: PFS and ORR in TPS ≥50%, ≥20%, and ≥1%; safety in TPS ≥1%
- Exploratory: DOR, PFS2[d]

AUC, area under the curve.DOR, duration of response.
[a]Assessed in formalin-fixed tumor samples using PD-L1 IHC 22C3 pharmDx assay (Agilent Technologies, Carpinteria, CA, USA), with expression measured using TPS (defined as the percentage of tumor cells with membranous PD-L1 staining). [b]Patients randomized to pembrolizumab who completed 35 treatment cycles with SD or better or stopped treatment after confirmed CR could receive second-course pembrolizumab after disease progression if eligibility criteria were met. [c]Pemetrexed maintenance therapy was optional but strongly encouraged for patients with nonsquamous histology. [d]PFS2 was defined as the time from randomization to subsequent disease progression after initiation of new anti-cancer treatment or death from any cause, whichever occurred first.



HR, hazard ratio.
Data cutoff date: February 21, 2020.

IMpower 110 Study Design



- Primary endpoint: OS in WT population[f]
- Key secondary endpoints: investigator-assessed PFS, ORR and DOR (per RECIST version 1.1)

IC, tumour-infiltrating immune cells; IHC, immunohistochemistry; nsq, non-squamous; PD, progressive disease; q3w, every 3 weeks; R, randomised; sq, squamous; TC, tumour cells; WT, wild-type. [a] PD-L1 expression (VENTANA SP142 IHC assay) ≥ 1% on TC or IC. [b] TC1/2/3 and any IC vs TC0 and IC1/2/3. [c] 554 patients in the WT population. [d] Cisplatin 75 mg/m² or carboplatin area under the curve (AUC) 6 + pemetrexed 500 mg/m² IV q3w. [e] Cisplatin 75 mg/m² + gemcitabine 1250 mg/m² or carboplatin AUC 5 + gemcitabine 1000 mg/m² IV q3w. [f] WT population excludes patients with *EGFR*+ and/or *ALK*+ NSCLC.

OS: TC3 or IC3 WT (IMpower110 Study Design)

High PD-L1 expression WT

Landmark	Arm A (atezo) n = 107	Arm B (chemo) n = 98
6-mo OS (95% CI), %	76.3 (68.2, 84.4)	70.1 (60.8, 79.4)

Herbst et al, NEJM 2021

EMPOWER-Lung 1 Study Design (NCT03088540)

Key Eligibility Criteria
- Treatment-naïve advanced NSCLC
- PD-L1 ≥50%
- No *EGFR*, *ALK* or *ROS1* mutations
- ECOG PS 0 or 1
- Treated, clinically stable CNS metastases and controlled hepatitis B or C or HIV were allowed

Stratification Factors:
- Histology (squamous vs non-squamous)
- Region (Europe, Asia or ROW)

N=710

Five interim analyses were prespecified per protocol

Second interim analysis (1 March 2020) presented here

R 1:1

Arm A
Cemiplimab monotherapy IV
350 mg Q3W
Treat until PD or 108 weeks

PD → **Optional continuation of cemiplimab + 4 cycles of chemotherapy**

Arm B
4–6 cycles of investigator's choice chemotherapy

PD → **Optional crossover to cemiplimab monotherapy**

Follow-up

Endpoints:
- Primary: OS and PFS
- Secondary: ORR (key), DOR, HRQoL and safety

ALK, anaplastic lymphoma kinase; chemo, chemotherapy; CNS, central nervous system; DOR, duration of response; ECOG PS, Eastern Cooperative Oncology Group performance status; EGFR, epidermal growth factor receptor; HIV, human immunodeficiency virus; HRQoL, health-related quality of life; IV, intravenous; NSCLC, non-small cell lung cancer; ORR, objective response rate; OS, overall survival; PD, progressive disease; PFS, progression-free survival; Q3W, every 3 weeks; R, randomised; ROS1, c-ros oncogene 1; ROW, rest of the world.

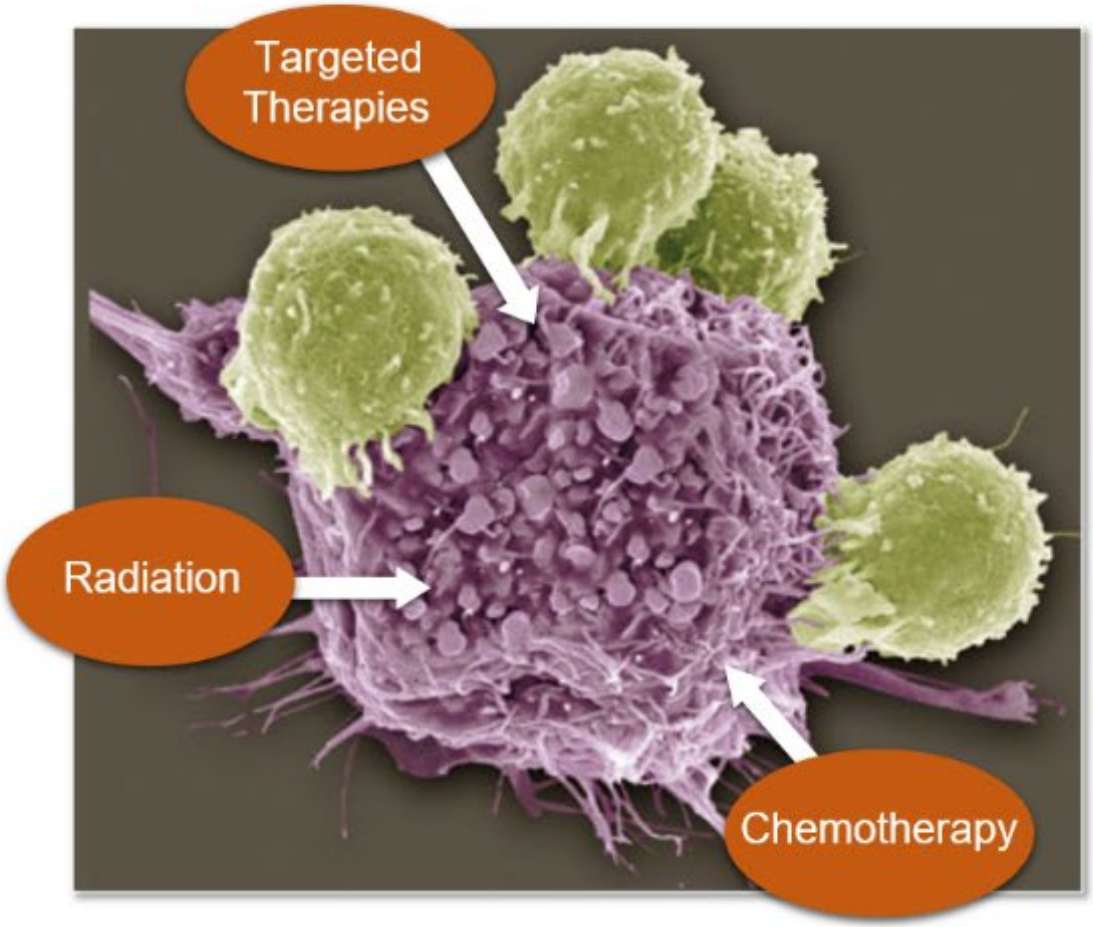
Rationale for Combination Therapy: Chemo-IO

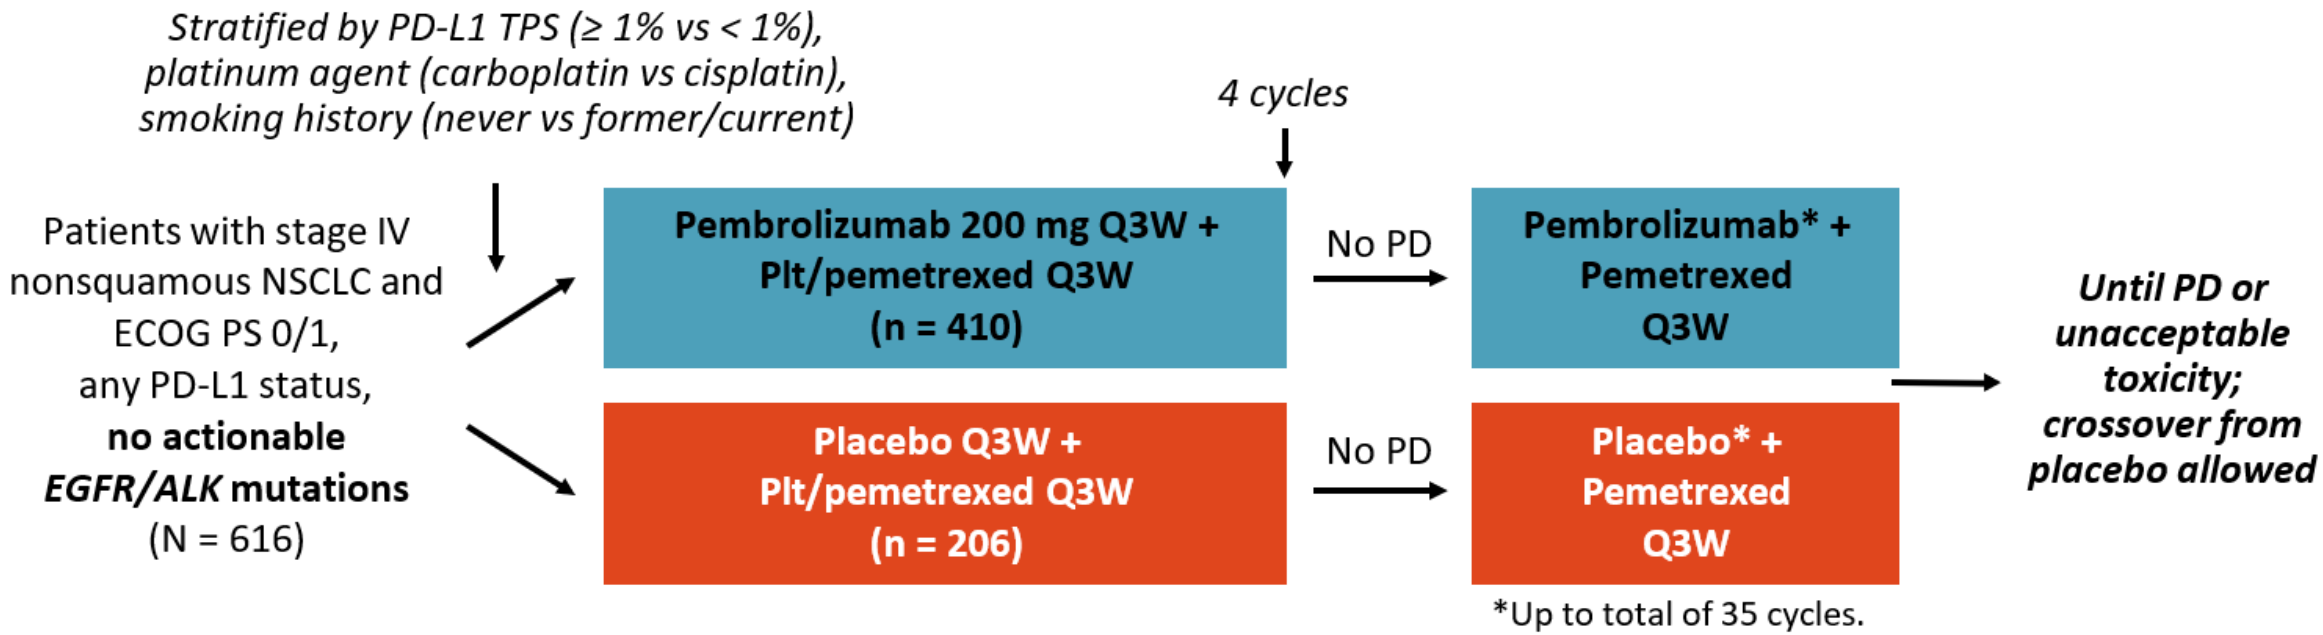


Adapted from M. Sznol, Yale Cancer Center

- **Reduces tumor bulk** – Improves T-cell: tumor target ratio.
- **Separate mechanism of kill** – 'synergize' with T-cell mechanism of killing.
- **Reduces T-cell inhibitory substances** produced by tumor.
- Alters tumor barriers (vasculature/pressure) to T-cell penetration.
- Kills tumor cells in a manner that increases their recognition by T-cells and APC (vaccination).
- Alters T-cell signaling/gene expression to produce T-cell attractants.

KEYNOTE-189: First-line Pembrolizumab + CT vs Placebo + CT in Stage IV Nonsquamous NSCLC

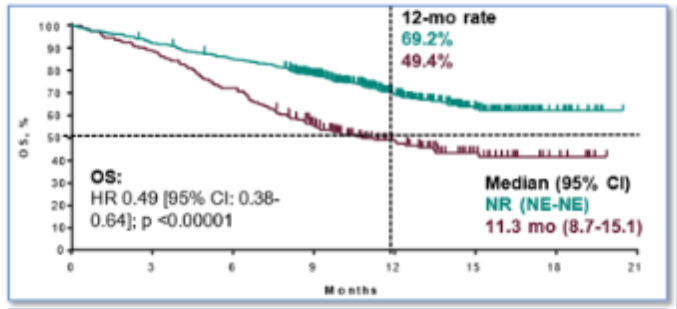
- Randomized, double-blind, international phase III study

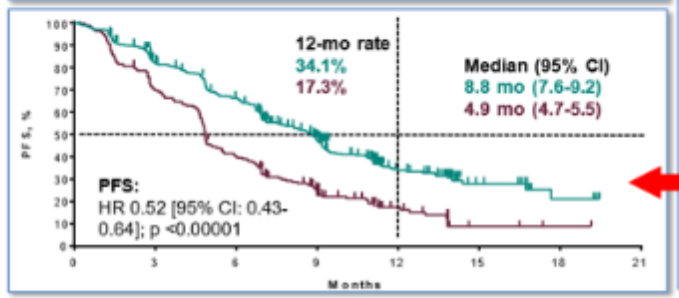


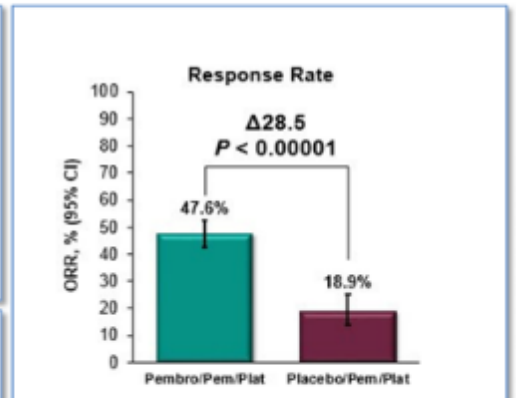
- ❑ Primary endpoints: OS, PFS by BICR
- ❑ Secondary endpoints: ORR, DoR, safety

Gandhi L, et al. N Engl J Med. 2018;[Epub ahead of print]. ClinicalTrials.gov. NCT02578680.

KEYNOTE 189: Pembrolizumab (PD1 plus Chemotherapy)
Met All Primary Endpoints







Subgroup Analyses
OS: Positive across all subgroups
PFS: Positive across all subgroups except for PD-L1 TPS <1%

Gandhi et al, *N Engl J Med* 2018; 378:2078-2092

2022 ESMO Congress

OS: KN 189 – no plateau, few % loss every year

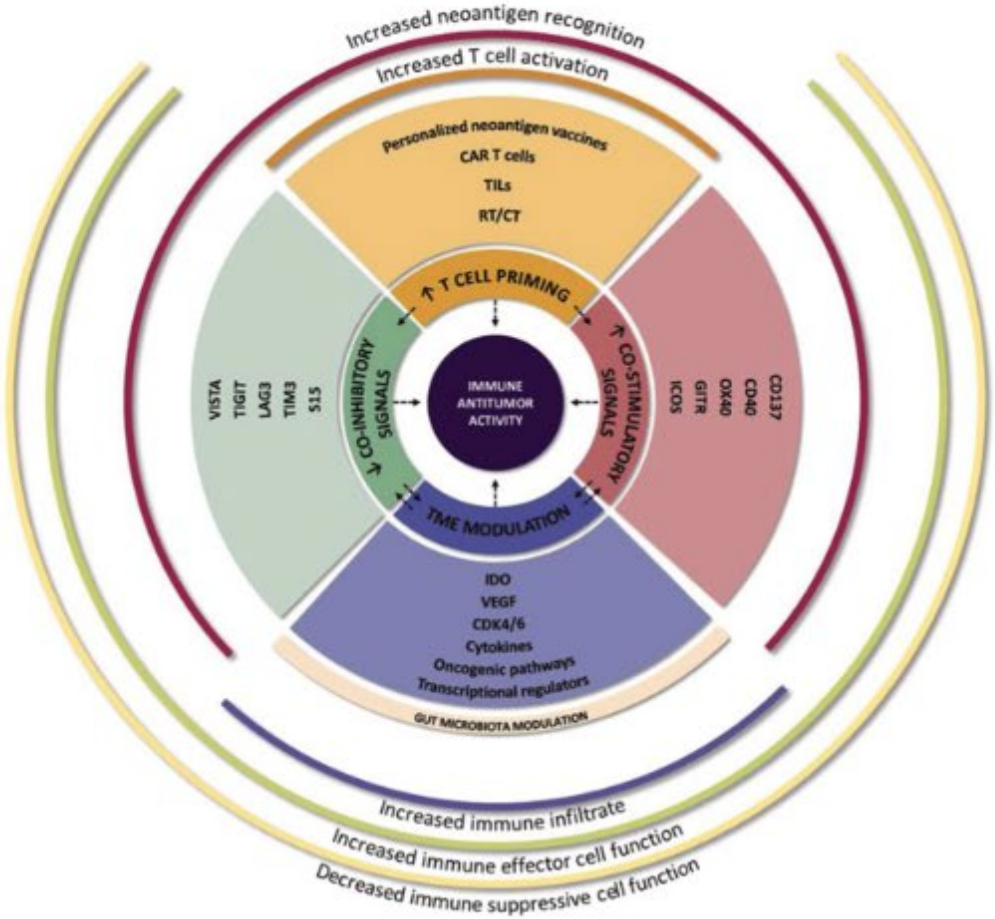
Immunotherapy Combinations



Attilli I, Lung Cancer 2021

Receptor and ligands	Mechanism of action	Current status	Examples of agents
Co-inhibitory receptors			
CTLA4 — CD80/86	Limits initial T cell activation and proliferation	FDA-approved	Ipilimumab, tremelimumab
PD1 — PD-L1	Inhibits the activity of effector T cells	FDA-approved	Nivolumab, pembrolizumab, durvalumab, atezolizumab
LAG3 — MHC II	Inhibits the activity of effector T cells via the KIEELE motif, which is functionally linked with T_{reg} cell-mediated immunosuppression	Phase III trial ongoing	Relatlimab
TIM-3 — Galectin-9, CEACAM1	Triggers $CD8^+$ T cell apoptosis and/or exhaustion	Phase II trials ongoing	Cobolimab, sabatolimab
TIGIT — CD155, CD112	Downregulation of T cell and NK cell function	Phase II trials ongoing	Tiragolumab
BTLA — HVEM	Suppression of downstream activation of TCR signalling via SH2	Phase I trials ongoing	Icatolimab
Co-stimulatory receptors			
GITR — GITRL	Promotes activation and proliferation of effector T cells and a reduction in T_{reg} cells	Phase II trials ongoing	TRX518, BMS-986156
OX40 — OX40L	Promotes survival, but not priming, of both effector and memory T cells	Phase II trials ongoing	GSK3174998, MEDI6469, PF-04518600
4-1BB — 4-1BBL	Promotes T cell proliferation and mitochondrial function and biogenesis	Phase I trials ongoing	Utomilumab, urelumab
ICOS — ICOSL	Promotes TCR co-stimulation and T_{reg} cell stimulation	Phase I trials ongoing	Vopratelimab, KY1044, GSK3359609

SAVE THE DATE

Sharing Best Practices to Optimize Patient Care in Lung Cancer

October 21 and 24, 2022

VIRTUAL MEETING

Friday, October 21, 2022
4.00 PM – 8.00 PM EDT

Monday, October 24, 2022
4.00 PM – 7.00 PM EDT

CHAIR
Corey J. Langer, MD, FACP
University of Pennsylvania Perelman School of Medicine, USA

CO-CHAIR
Carlos H. Barrios, MD
Oncology Research Center Hospital São Lucas, PUCRS, Brazil

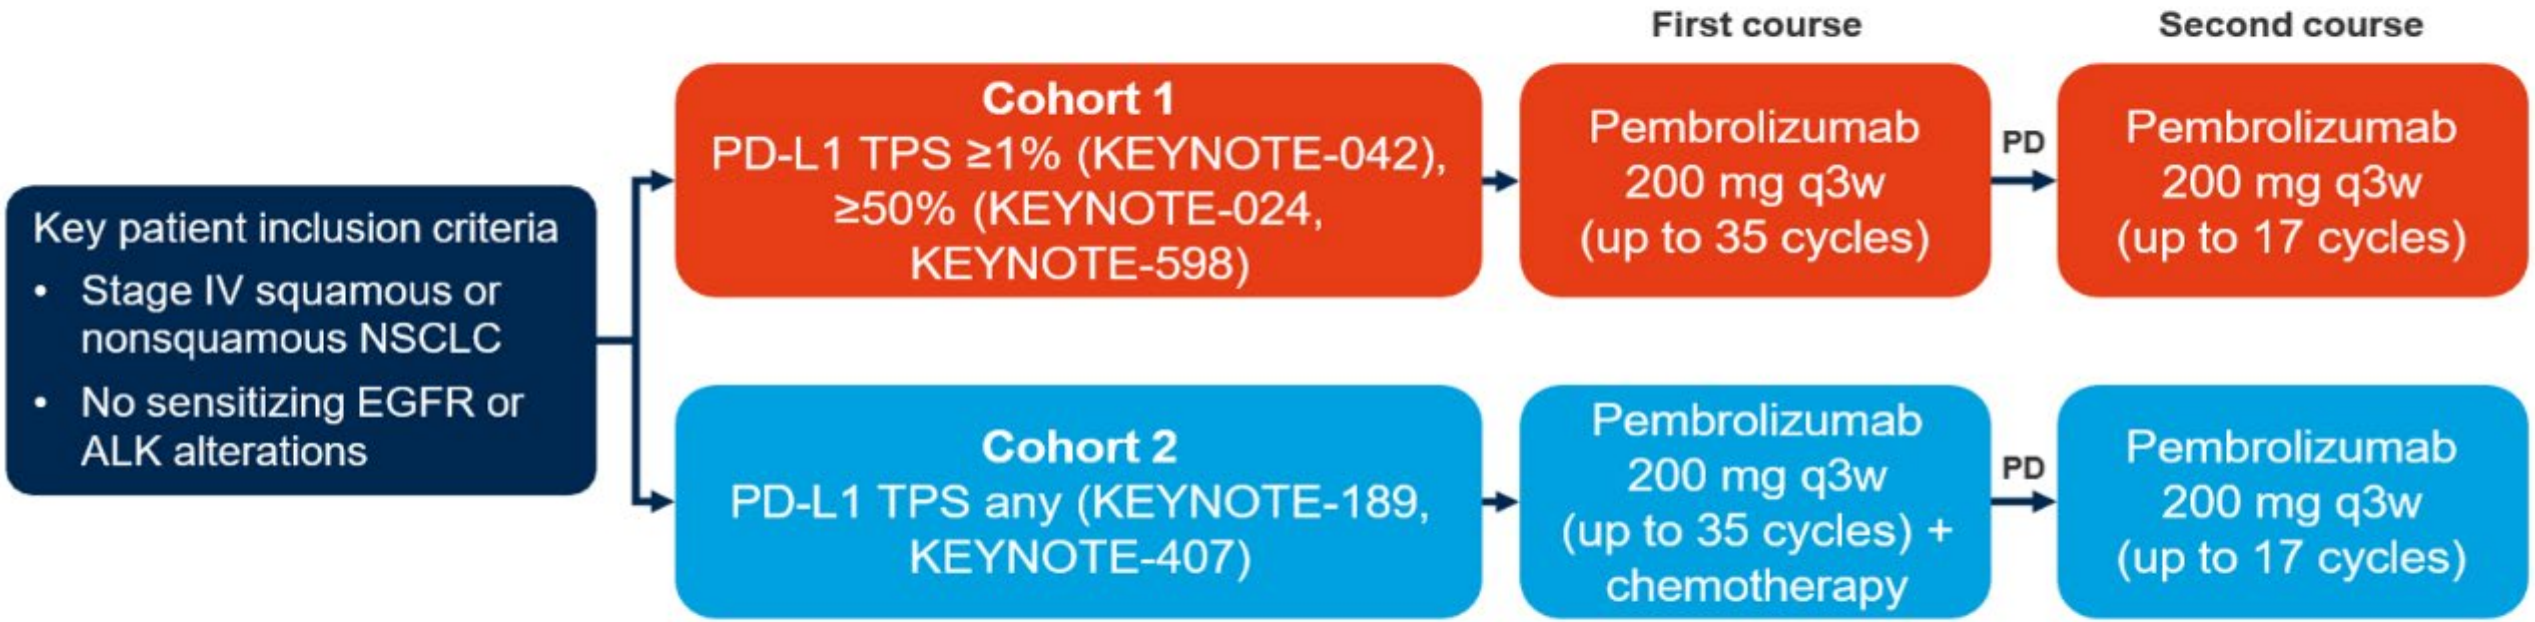
- Rechallenge

KN189: 19% OS at 5 yrs (n=77). Completed 35 Cycles of Pembrolizumab – 57/410 – 14%, 23/410 (who completed 35 cycles) + 54/410 (less than 35 cycles) alive with/without PD =19%.

	n = 57
ORR (95% CI),[a] %	86.0 (74.2–93.7)
Best overall response, n (%)	
CR	8 (14.0)
PR	41 (71.9)
Median DOR (range),[b] mo	57.7 (4.2 to 68.3+)
3-y OS rate after completing 35 cycles[c]	71.9%
Alive without PD or subsequent therapy, n (%)	23 (40.4)

M. O'Brien. 2022 ESMO Congress.

Pooled Analysis of Outcomes With Second-Course Pembrolizumab Across 5 Phase 3 Studies of Non-Small-Cell Lung Cancer – Rodriguez-Abreu D, et al

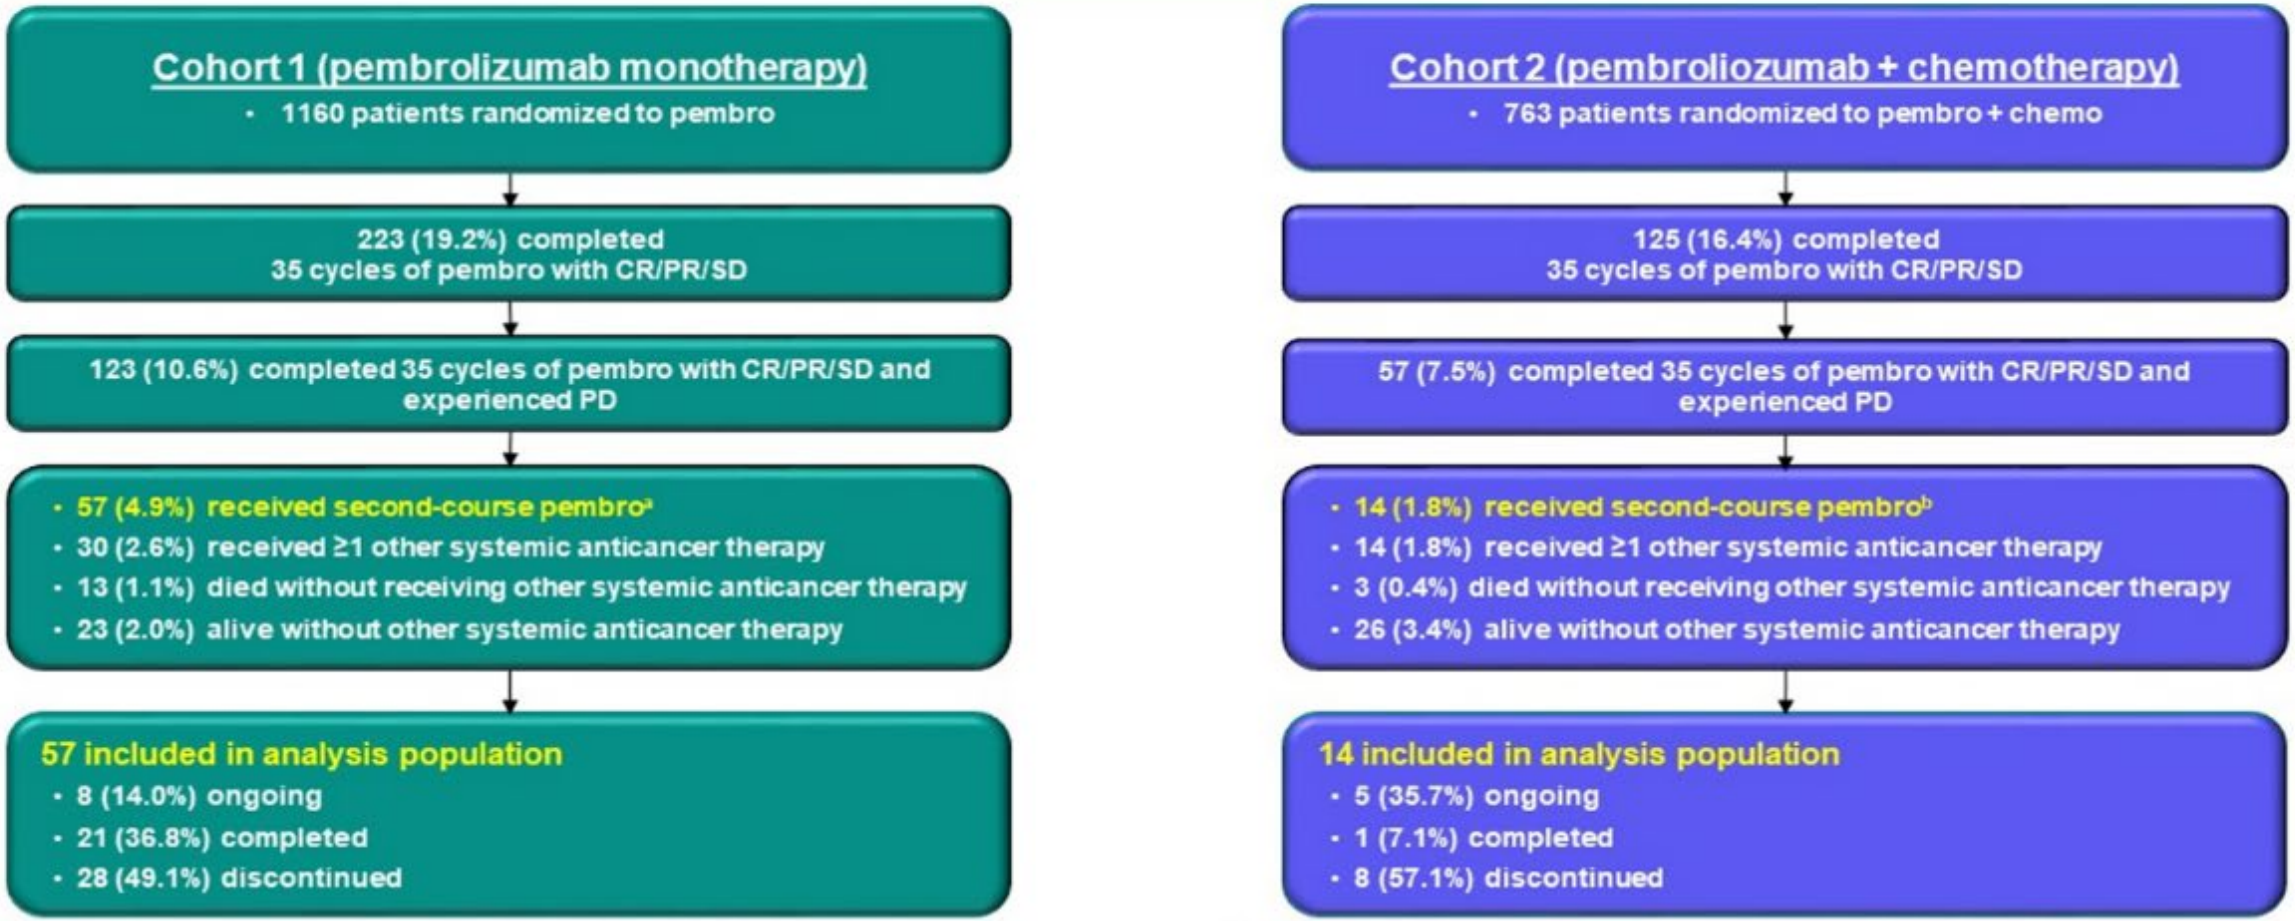


Endpoints

- ORR, DCR, DoR, OS, PFS, safety

Rodriguez-Abreu D, et al. J Thorac Oncol 2022;17(suppl):Abstr OA15.06

Patient Disposition



- **Median duration on second course:** 8.3 mo (95% CI, 5.6–NR)
- **Remaining on second-course pembro at 6 mo:** 62.8% (95% CI, 48.5%–74.2%)

- **Median duration on second course:** 7.6 mo (95% CI, 1.4–NR)
- **Remaining on second course pembro at 6 mo:** 55.0% (95% CI, 25.8%–76.8%)

[a]1 patient completed 35 cycles after assessment of PD by BICR but PR per investigator; 1 patient did not complete 35 cycles because of CR assessment.
[b]2 patients did not complete 35 cycles but did receive 2 years of treatment.
Database cutoff dates: Jun 1, 2020 (KN024); Apr 28, 2021 (KN042); Oct 1, 2021 (KN598); Aug 28, 2020 (KN189); Sep 30, 2020 (KN407).

D Rodriguez-Abreu. 2022 WCLC.

Conclusion

2 yrs of treatment is a very good standard. *Only 5% overall had rechallenge* – particularly if treated with IO alone initially and >1% PDL1

Around 10%, with 35 cycles and LESS are alive without disease - ?cure.

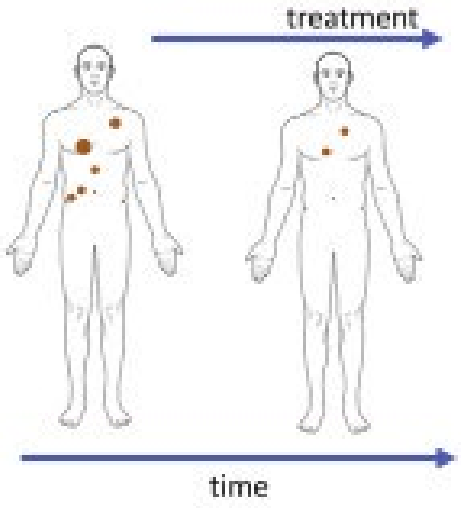
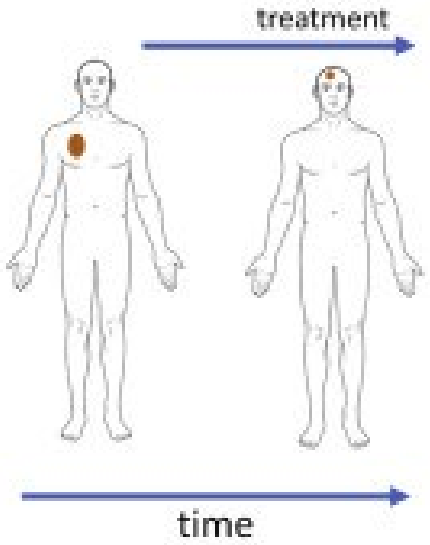
De novo synchronous oligometastastic disease

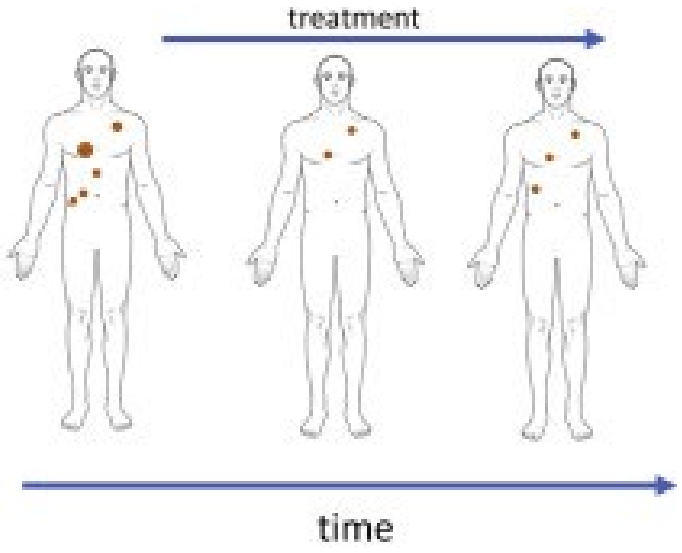
Oligopersistent disease



De novo metachronous oligometastastic disease



Oligoprogression



Patients with few metastases at diagnosis are described as having de novo oligometastases, whereas patients who are widely metastatic but become oligometastatic after systemic therapy are referred to as having induced oligometastases.

HARVARD MEDICAL SCHOOL

Florez Lab

Stephens SJ, et al. *J Oncol Pract*. 2018;14:23-31.

Oligometastatic NSCLC

- Evidence from preclinical and retrospective studies suggest that some patients with metastatic NSCLC may have a less aggressive or “limited metastatic” phenotype and may benefit from more aggressive therapy; this is known as “oligometastatic disease”
- Patients with oligometastases in NSCLC seem to be common (up to 50%) and have improved outcomes compared with those with more widespread disease

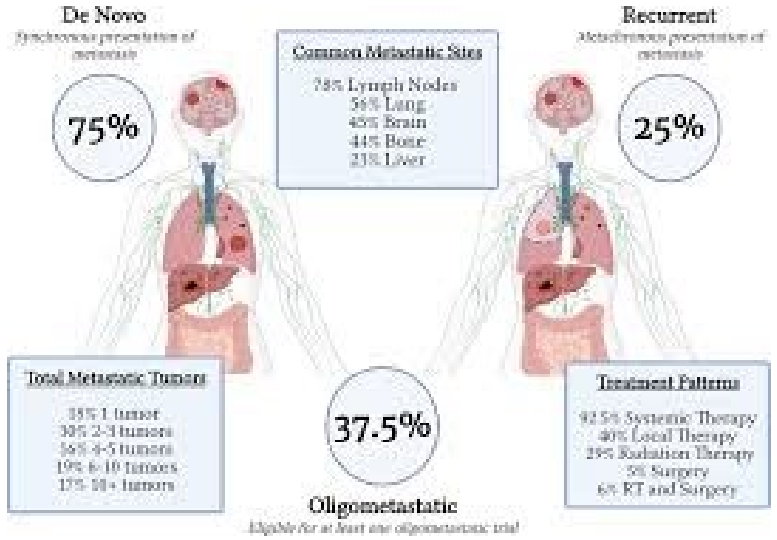
So, What Defines Oligometastatic Disease in NSCLC?

- Oligometastases means limited or few metastases and is rarely defined further. Although most studies have limited their focus to patients with **5 or fewer metastases,** some studies have defined it as up to 8 metastases

- But the location of the metastases also matters, eg, same organ, contralateral lung

Characterization of Metastatic Non-small Cell Lung Cancer and Oligometastatic Incidence in an Era of Changing Treatment Paradigms

- 37.5% of patients were classified as oligometastatic, 28.3% meeting criteria for the MD Anderson Cancer Center trial
- Of those tumors identified as oligometastatic, 44.4% received local therapy and 28.9% underwent ablative therapy to all sites
- There was a trend toward greater overall survival (44.4 vs 24.9 months; *P* = .055) and progression-free survival (8.0 vs 5.4 months; *P* = .06) in patients meeting eligibility for at least 1 oligometastatic trial



Joshua, et al. RED, ASTRO. 2022.

Does the Site of Disease Matter?

- Historically, the greatest experience—and perhaps greatest benefit—with local treatment in oligometastatic NSCLC has been observed with brain metastases—particularly with solitary brain metastasis

- For patients on molecularly targeted therapies, because oligoprogression in the brain is likely to represent pharmacokinetic failure rather than molecular evolution, continuation of the original targeted therapy after local treatment may result in prolonged disease control

- Bone metastases can also be easily controlled with local therapy in the oligometastatic setting

- Liver lesions with ablation has also been successfully treated (ablation)

Tanvetyanon T, et al. *J Clin Oncol.* 2008;26:1142-1147;
Grommes C, et al. *Neuro Oncol.* 2011;13:1364-1369;
Weickhardt AJ, et al. *J Thorac Oncol.* 2012;7:1807-1814.

We NEED Systemic Control of the Disease First

- Patients with oligometastases cannot be selected solely by the number of metastases and/or the number of organs involved

- Only 20%–25% of patients with limited metastases have favorable outcomes with either no further progression or limited progression

- Ideally, patients with oligometastases can be identified early on the basis to response to therapy

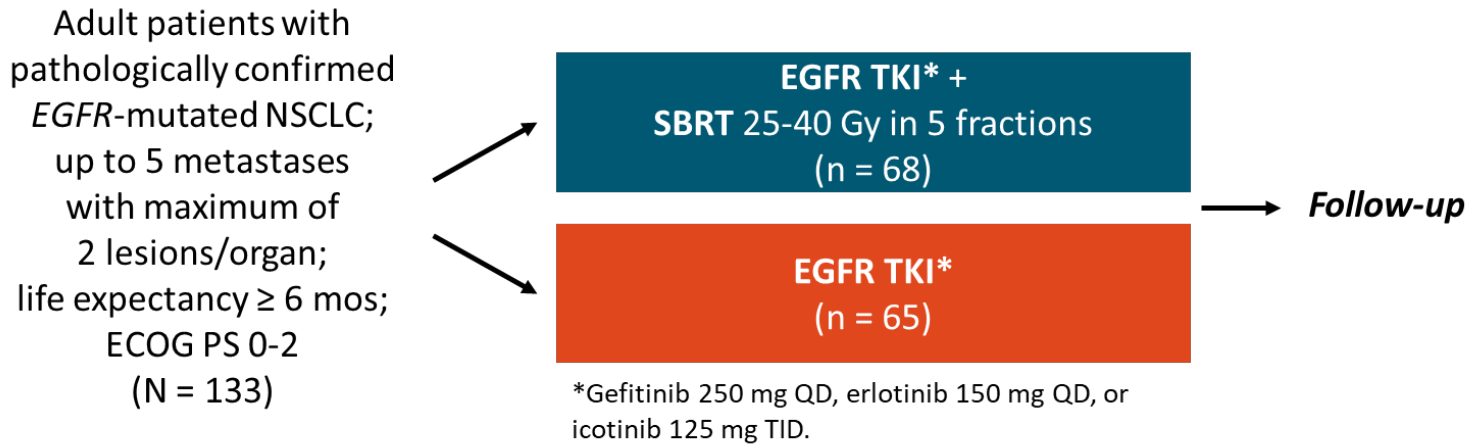
Phase III SINDAS: Interim Analysis of First-Line EGFR TKI With vs Without SBRT in Patients With *EGFR*-Mutated Oligometastatic NSCLC

SINDAS: Study Design

- Multicenter, open-label, randomized phase III trial in China (January 2016 - June 2019)



- Primary endpoint: PFS
- Secondary endpoint: OS
- Other endpoint: safety

Wang. ASCO 2020. Abstr 9508.

Wang X, et al. ASCO 2020. Abstract 9508.

Florez Lab

Phase III SINDAS Trial

Median Outcome, Mo	EGFR TKI + SBRT (n = 68)	EGFR TKI Only (n = 65)	HR
PFS (primary endpoint)	20.2	12.5	0.618 (95% CI: 0.394–0.969; log-rank *P* <.001)
OS (secondary endpoint)	25.5	17.4	0.682 (95% CI: 0.456–1.001; log-rank *P* <.001)

- After median follow-up of 19.6 mo, EGFR TKI + SBRT significantly prolonged PFS and OS vs EGFR TKI only

Wang X, et al. ASCO 2020. Abstract 9508.

Florez Lab

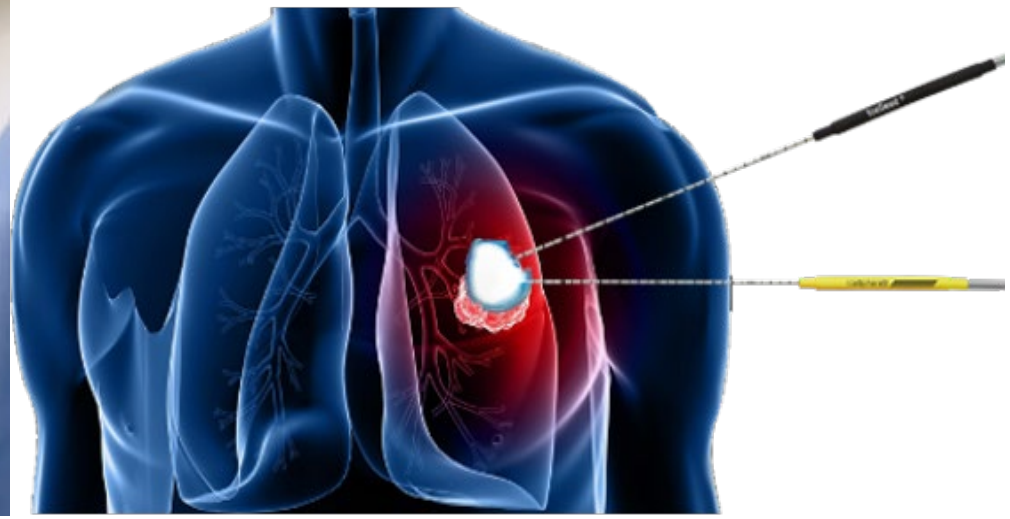
SINDAS Interim Analysis: Safety

Grade 3 AE, n	EGFR TKI + SBRT	EGFR TKI Only	*P* Value
All	20	13	
Skin rash	10	8	.423
Pneumonitis	6	2	.338
Esophagitis	3	2	.976
Pathological rib fracture	1	0	.413
Severe liver injury	0	1	.208

- No significant differences observed in distribution of types of grade 3 AEs between arms
- No grade 5 AEs or treatment-related deaths

Wang X, et al. ASCO 2020. Abstract 9508.

How Have These Patients Been Treated?



Dana-Farber Cancer Institute

HARVARD MEDICAL SCHOOL

Joshua, et al. RED, ASTRO. 2022.

Florez Lab

Any Survival Benefit?

- In a randomized phase II study, local consolidative therapy + SOC maintenance treatment, including observation, significantly prolonged PFS vs maintenance alone in patients with NSCLC and 1–3 oligometastases after first-line systemic therapy
  - Median PFS: 11.9 vs 3.9 mo (HR: 0.35; *P* = .005)
  - Adding LCT also delayed the appearance of new lesions, implying that the benefit of consolidation may extend beyond known sites of disease

Table 2. **Completed Randomized Phase 2/3 Trials of LAT in Patients With OM-NSCLC**

Study	N	Setting	OMD definition and evaluation			Brain metastases	Timing of LAT	Systemic therapy	Dose and number of fractions	Toxicity
			Number of lesions	Primary tumor	Lymph nodes[a]					
SABR-COMET 2019, 2020[8,26]	99 (NSCLC, n = 18)	M: 100%	▪ ≤5 per protocol ▪ 1: 42% ▪ 2-3: 51% ▪ 4-5: 7%	▪ Not treated ▪ Required controlled primary tumor for 3 months	▪ Excluded per protocol ▪ 3% of patients had a lymph node as SBRT target (protocol violation)	▪ Included in OMD count ▪ 4% of patients affected	After registration	NR	▪ Lung: 54-60 Gy in 3-8 fractions ▪ Bone: 35 Gy in 5 fractions ▪ Vertebrae: 16-20 Gy in 1 fraction or 30 Gy in 3 fractions. ▪ Liver: 45-60 Gy in 3-8 fractions ▪ Adrenal: 60 Gy in 8 fractions	▪ Grade ≥2: 29% vs 9% ▪ Grade 5: 5% (2 pulmonary, 1 gastrointestinal) vs 0%
Iyengar 2018[6]	29	NR	▪ ≤6 prior to induction per protocol ▪ Number of lesions NR	Included in OMD count	▪ Included in OMD count but did not specify how ▪ 17.2% had involved N1 nodes ▪ 50% had involved N2 or N3 nodes	▪ Not included in A ▪ Required treatment prior to enrollment	After 4-6 cycles of CMT	Cytotoxic CMT, bevacizumab, or erlotinib	▪ 21-27 Gy in 1 fraction ▪ 26.5-33.0 Gy in 3 fractions ▪ 30.0-37.5 Gy in 5 fractions ▪ 45 Gy in 15 fractions (for bulky lymphadenopathy)	Grade ≥3: 0% vs 0%
Gomez 2016, 2019[16,27]	49	S: 94% M: 6%	▪ ≤3 post induction, per protocol ▪ 1: 6.1% ▪ 2-3: 93.9%	Included in OMD count	▪ Included in OMD count. Each level (N1-N3) counted as a site of OMD ▪ Involved N1 nodes: 24.5% ▪ Involved N2/3 nodes: 53%	▪ Included in OMD count ▪ 27% of patients affected	▪ After 4-6 cycles of CMT ▪ LAT could be surgery or radiotherapy	Cytotoxic CMT, bevacizumab, or erlotinib	▪ Brain: 15-20 Gy in 1 fraction ▪ Lung: variety of SBRT, hypofractionated, and conventional regimens ▪ Bone: 18-45 Gy in 1-15 fractions ▪ Adrenal: 60 Gy in 8 fractions	▪ Grade 3: 20% vs 8.3% ▪ Grade 4/5: 0%
SINDAS 2020[50]	133 (*EGFR*-mutant)	S: 100%	▪ ≤5 per protocol ▪ 1-2: 48.6% ▪ 3-4: 28.6% ▪ 5: 12.8%	Included in OMD count	▪ Included in OMD count. Each involved node counted separately ▪ Number of patients with involved nodes NR	Brain metastases excluded	After registration	Erlotinib, gefitinib, or icotinib	25-40 Gy in 5 fractions	▪ Grade 3/4 pneumonitis (7.3% vs 2.9%) ▪ Grade 3/4 esophagitis (4.4% vs 3.0%)

CMT, chemotherapy; LAT, local ablative therapy; M, metachronous disease presentation; NR, not reported; NSCLC, non–small cell lung cancer; OM-NSCLC, oligometastatic NSCLC; OMD, oligometastatic disease; S, synchronous disease presentation; SBRT, stereotactic body radiotherapy.

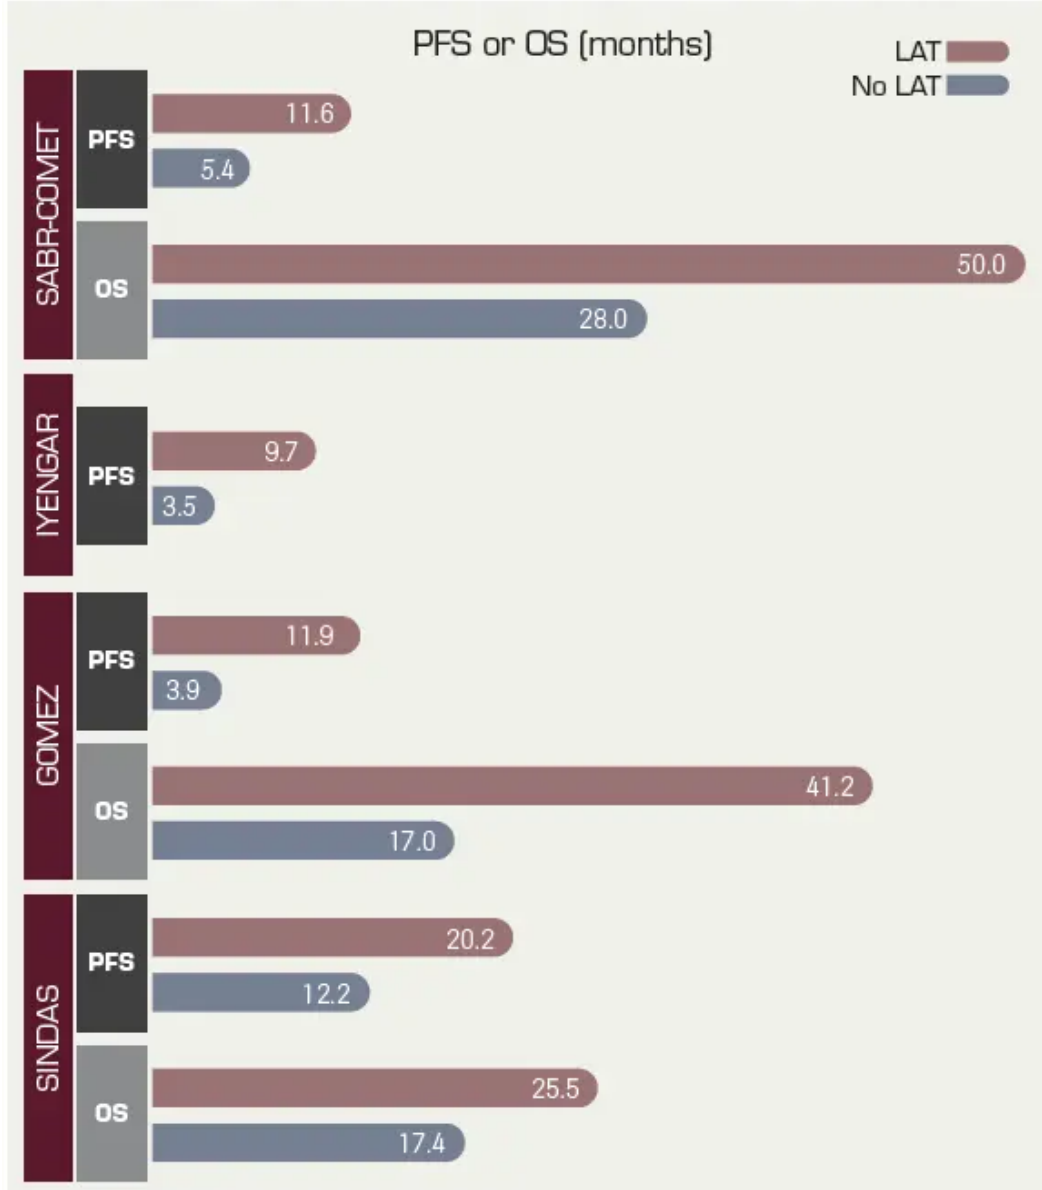
[a]N1, N2, and N3 refer to nodal group staging as defined by the American Joint Committee on Cancer, 8th edition.

Dana-Farber Cancer Institute

HARVARD MEDICAL SCHOOL

Florez Lab

Figure. **Outcomes of Completed Phase 2/3 Trials of LAT in OM-NSCLC[a]**



LAT, local ablative therapy; OM-NSCLC, oligometastatic non–small cell lung cancer; OS, overall survival; PFS, progression-free survival.

[a]PFS and OS are plotted for each of the 4 trials involving LAT. Of note, values plotted in the SABR-COMET trial reflect the entire cohort (N = 99) rather than those with OM-NSCLC; N = 18. OS in the Iyengar trial was not reached and is therefore not shown.

NRG-LU002

- RG-LU002, comparing local consolidative therapy (LCT) and maintenance systemic therapy to maintenance systemic therapy alone for limited-metastatic non-small cell lung cancer (NSCLC)

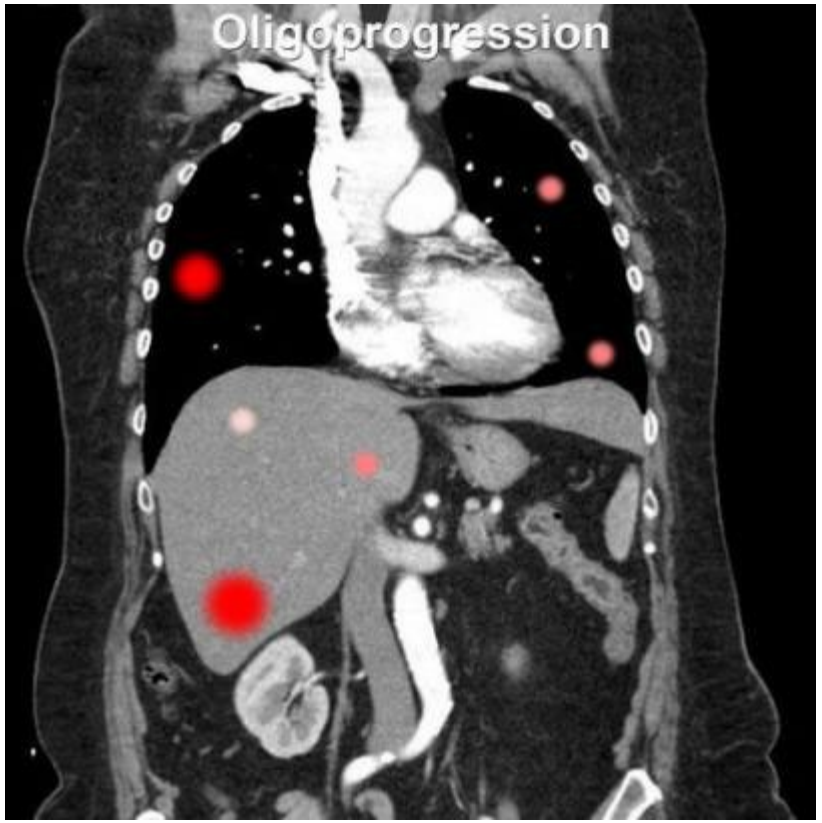
- Patients with limited metastatic NSCLC who had completed at least 4 cycles of first-line systemic therapy and had displayed no signs of progression. Patients were randomly assigned to receive either maintenance systemic therapy alone, or LCT

- Phase II suspended for interim monitoring, July 2022

Oligoprogressive disease is a relatively new clinical concept describing progression at only a few sites of metastasis in patients with otherwise controlled widespread disease.

The origin of oligoprogressive disease is considered complex and has numerous parameters, including

1. Molecular evolution of cancer cells
2. Changes in the tumor microenvironment
3. Hemodynamic parameters
4. Previous application of local therapies
5. Unique disease characteristics



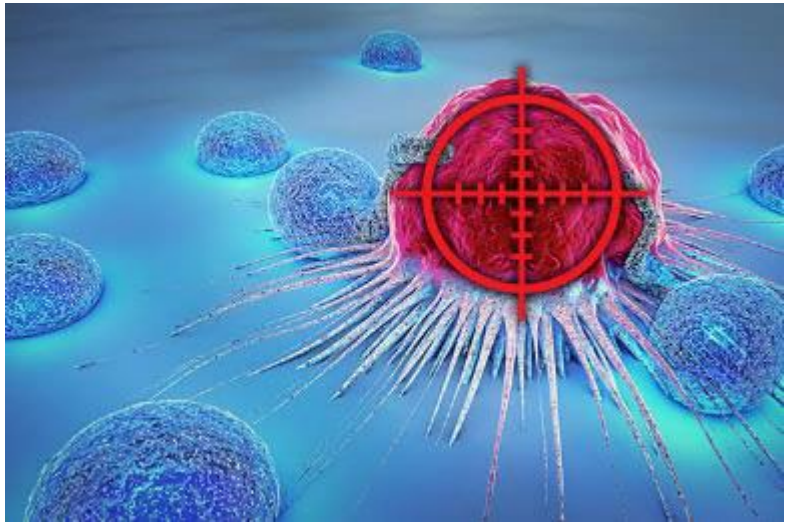
In the Era of Well-tolerated Targeted Treatments, Resistance Inevitably Occurs, and Overcoming This Is a Challenge

Dana-Farber Cancer Institute

HARVARD MEDICAL SCHOOL

Florez Lab

Notwithstanding, from a therapeutic point of view, oligo-progression carries a very simple and important implication: **the opportunity to regain control of disseminated tumors by use of local treatments**, which can thereby prolong benefit from systemic therapies and patient survival



Dana-Farber Cancer Institute

Male, 44 Years Old, No Comorbidities

- Asymptomatic
- Not on any medication
- Never smoker
- Occasional drinker
- Lives in London with wife and 18-month-old boy
- Currently unemployed/works in risk management

Family history

- Mom diagnosed with breast cancer at 45 and died later of a retroperitoneal sarcoma
- Brother diagnosed with a metastatic salivary gland adenocarcinoma
- Brother goes for genetic counseling and tested positive for m*TP53* (R337H) – Li-Fraumeni syndrome
- Patient also tests positive for a germline *TP53* mutation

During a short visit to Brazil, patient decides to see his brother's geneticist and to perform his first-ever screening whole-body MRI. He tried to get this in the UK but was told he had no coverage since the test is not cost-effective.

Report

MOLECULAR PATHOLOGY SUPPLEMENTARY REPORT

Results:

Histology block:	22H00015459 block A1
Tissue adequacy:	20% tumour cells (without macrodissection)
Analysis method:	COBAS 480
Target(s):	EGFR (Exons 18-21)
Reference cDNA sequence:	NM_005228.3 (EGFR)
Result:	Mutation detected
Details:	c.2573T>G or c.2573_2574TG>GT p.Leu858Arg (L858R)

Interpretation:

The specimen was suitable for molecular analysis, based on tumour cellularity.

An EGFR mutation (L858R) was detected in this sample. This is consistent with a mutant EGFR tumour and this patient may benefit from EGFR-inhibitor therapy.

Male, 44 Years Old, Li-Fraumeni, ECOG 0, Lung Adenocarcinoma – cT1 pN3 – CS IIIC *EGFR*m – L858R

How would you treat him?

1. Encourage the patient to have CRT alone
2. Encourage the patient to have CRT + durvalumab
3. Neoadjuvant (+/- IO) CT followed by surgery (+/- osimertinib)
4. Resection upfront and adjuvant osimertinib
5. Immunotherapy
6. Neoadjuvant/palliative osimertinib
7. Other

Male, 44 Years Old, Li-Fraumeni, ECOG 0, Lung Adenocarcinoma – cT1 pN3 – CS IIIC *EGFR*m – L858R

- ✓ Patient declined radiotherapy
- ✓ Demanded to be considered for surgery

Male, 44 Years Old, Li-Fraumeni, ECOG 0, Lung Adenocarcinoma – cT1 pN3 – CS IIIC *EGFR*m – L858R Declined RxT

April 26, 2022:
Started on neoadjuvant osimertinib 80 mg qid (off-label)

May 5, 2022:
PET-CT already showing decrease in size of both the lung tumor and mediastinal LNs

- Male, 44 years old, Li-Fraumeni, ECOG 0, lung adenocarcinoma – cT1 pN3 – CS IIIC *EGFR*m – **L858R**
- **Neoadjuvant *(off-label)* osimertinib April 2022**
- 4 months → PET-CT shows **no mediastinal uptake + reduced size in lung**
- Right upper lobectomy + radical LN dissection in **August 2022**

SITE OF SPECIMEN:

A) Right upper lobe.
B) Station 2 to 4 en bloc in packet.
C) Station 7.
D) Station 8.
E) Station 9.
F) Station 10.
G) Station 11.
H) Station 11 lower.
J) N3 node.

A) Pot labelled right upper lobe.
A lobe of lung measuring 90x75x65mm. The bronchial margin is stapled. There is a 29mm subpleural tumour which is well away from the trimmed bronchial margin. There is adjacent inflammatory change which may represent regression. The background lung is otherwise unremarkable.

B) The station 2-4 lymph nodes show evidence of previous tumour involvement, including fibrosis and collections of foamy macrophages. There is no residual viable tumour present.

C-H) These lymph nodes do not show any evidence of tumour involvement.

J) The N3 lymph node contains areas of fibrosis which would be consistent with previous tumour involvement. No residual viable tumour is present.

Histological type		: Adenocarcunoma
Maximum tumour diameter		: 7mm
Maximum invasive tumour diameter (non-mucinous adenocarcinoma)	: 7mm	
Visceral Pleural Invasion (VPI)		: Absent (PL0)
Vascular invasion		: Absent
Resection margins:		
- Bronchial		: Clear
- Vascular		: Clear
Lymph node metastases		: Absent
TNM stage (8th edition, 2017)		: ypT1a, ypN0

Planned for 3 years of adjuvant osimertinib

Global Lung Cancer Academy

Patient case 2

Barbara Melosky, MD, FRCP

“Ms SC”

Presentation

- 71-year-old female Asian never smoker
- 2-month history of hemoptysis, fevers 38.5°
- Bitemporal headaches
- 6-pound weight loss

Investigations

CT chest on Feb 18, 2022

- RUL 6.3 × 6.0 × 5.2-cm mass
- Adjacent pleural thickening and abutting horizontal fissure

PET CT on March 5, 2022

Intensely FDG-avid mass within the RUL (SUV 24)

No direct chest wall involvement

No FDG-avid distant metastatic disease is demonstrated

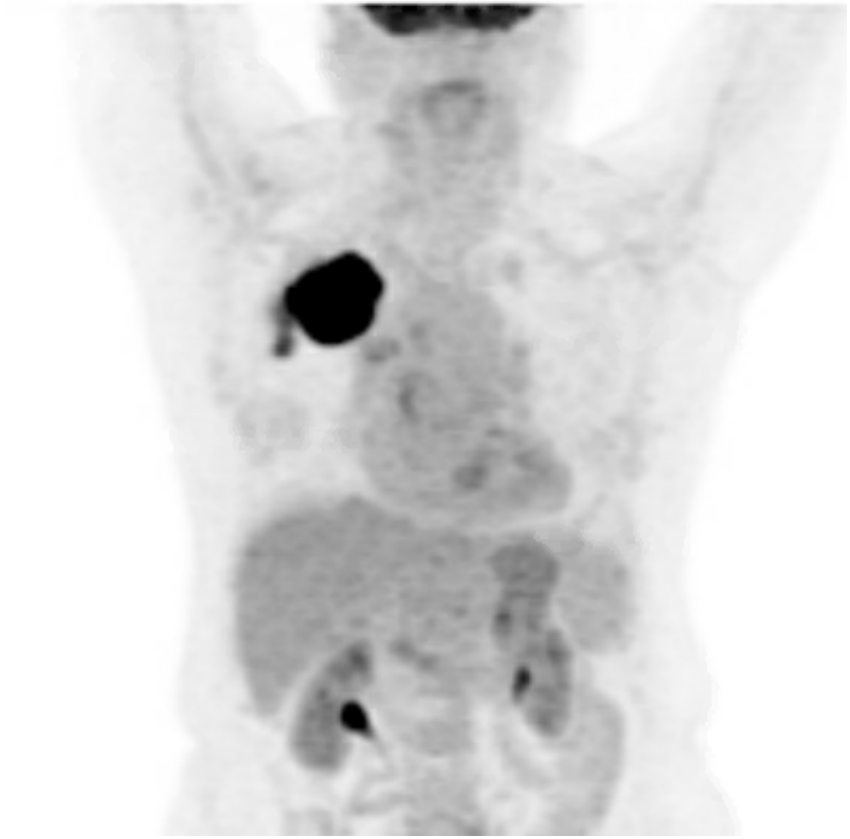
Pathology

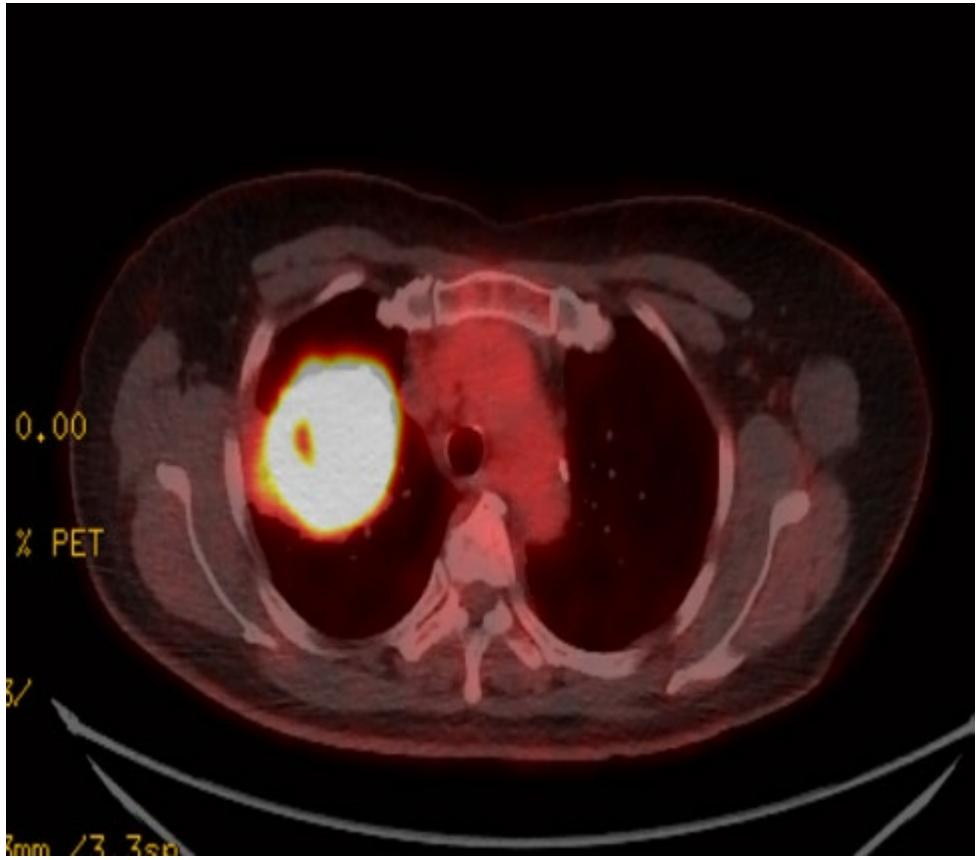
- EBUS on Feb 25, 2022
  - RUL: moderately differentiated squamous cell carcinoma
  - LN 11R, 11N, 7, 4R negative

EGFR M+ 19 deletion

--- TIER I: VARIANTS OF STRONG CLINICAL SIGNIFICANCE ---
EGFR:c.2240_2257del, p.Leu747_Pro753delinsSer (VAF:51.5%)
This exon 19 in-frame deletion results in activation of the receptor and constitutive EGFR pathway signaling. In non-small cell lung cancer, this mutation is predictive of sensitivity to anti-EGFR TKI therapies. First- to third-generation anti-EGFR TKIs are approved by the FDA and Health Canada for first-line treatment of non-small cell lung cancers carrying activating EGFR mutations.

PET Scan





Pathology

RUL Lobectomy on March 14

1. Adenosquamous carcinoma, 7.7 cm
2. All margins clear
3. Early visceral pleural invasion but not into chest wall
4. Bronchial resection margins negative
5. All nodes negative

Question 1

What stage is this patient?

Table 1

AJCC TNM staging system for lung cancer (6th edition, 2002)

Primary tumor (T)	
T1	Tumor ≤3 cm diameter without invasion more proximal than lobar bronchus
T2	Tumor >3 cm diameter; tumor with pleural invasion; partial lung atelectasis; proximal extent ≥2 cm from the carina
T3	Tumor of any size with: chest wall invasion; diaphragm, pericardium, or diaphragm involvement; complete lung atelectasis; proximal extent <2 cm from the carina
T4	Tumor of any size with: mediastinal, great vessel, trachea, esophageal, carinal or vertebral body invasion; malignant pleural or pericardial effusion; same lobe satellite nodule(s)
Nodal involvement (N)	
N0	No regional lymph node involvement
N1	Ipsilateral hilar and/or ipsilateral peribronchial nodal involvement
N2	Ipsilateral mediastinal and/or subcarinal nodal involvement
N3	Contralateral mediastinal or hilar nodal involvement; supraclavicular nodal involvement
Metastasis (M)	
M0	No distant metastasis
M1	Distant metastasis; metastatic tumor nodules in different lobes from the primary tumor
